Spanish potato, the sweet potato.—**Sweet potato.** (*a*) A plant of the convolvulus family, *Ipomœa Batatas*, or one of its spindle-shaped fleshy esculent roots. The plant is a creeping, rarely twining, vine, with variously heart-shaped, halberd-shaped, or triangular (sometimes cut-lobed) leaves, and a blossom like that of the common morning-glory, but less open, and rose-purple with a white border. Its value lies in the roots, which are richer in starch, and still more in sugar, than the common potato. Their use is very much that of the latter, but in Mexico they are said to be regarded as a sweetmeat, and in Spain they are made into a preserve. They are red, yellow, or white in different varieties, and range in weight from that of the common potato up to many pounds. A variety in the southern United States is called *yam*. The sweet potato appears to have originated in tropical America, but is referred by some to the East Indies, or to both hemispheres. It is widely cultivated in warm climates, and is successfully grown in the United States as far north as New Jersey and Illinois, and even Michigan. In 1874 it reached the Atlantic coast at several points, and it has since been a pest in almost the entire country. It has several times made its way to Europe, but has been stamped out. Both larva and beetle feed upon the leaves of the potato, and the pupa is formed in the earth at the foot of the plant. There are three generations annually, and the perfect beetles hibernate. potato-rot (pō-tā′tō-rot), *n.* A very destructive disease of the potato, caused by a parasitic fungus, *Phytophthora infestans*. It seems to have been introduced from South America, about the year 1840, and since that time has been the cause of very serious losses, sometimes involving almost the entire crop. The fungus attacks the stem and leaves as well as the tubers, and when confined to the leaves and stem is usually called *potato-blight*. On the leaves it first appears as pale-yellowish spots, which soon turn brown and finally black, indicating the total destruction of the tissues. On the tubers the parasite attains a considerable growth within the tissues before there is any external manifestation of its presence. After a time depressed spots appear, and the skin covering these dies and becomes discolored. Underlying these spots the tissue will be found to be dark-colored to a considerable depth. The flesh in the center of the tuber may remain for some time healthy and normal, but in the end it also decays, with either dry or wet rot. See *Phytophthora* and *mildew*.

The stock is placed in a machine constructed much like a breaking- or washing-engine, and called a *potching-engine*. The acid is very slowly dropped into the bleaching-liquid when the chlorin is to be generated in the mass, and, after the liberated chlorin has performed its work, the stuff is discharged into stone or earthenware chests having zinc strainers at the bottom, where the bleaching-liquid is drained off. When a solution of chlorin in water is used, it is added in proper quantity to the stock after washing, and the latter, after sufficient treatment, is drained as above described. (*d*) Specifically, in *homeopathy*, the power of a drug as induced by attenuation. Two scales of dilution or attenuation are employed, known as the *centesimal* and the *decimal*, the former being the one advocated by Hahnemann, and the latter of more recent introduction. In the decimal scale, one drop of the mother tincture is added to nine of the diluent, which is usually alcohol, with certain manipulations, and from this first decimal solution or potency one drop is taken, to form, with nine others of the diluent, the second decimal solution. This process is repeated till the required solution or potency is reached. Drugs of high potency are those of which the dilution has been frequently repeated, and the medicinal substance correspondingly attenuated; drugs of low potency, on the other hand, are those in a less diluted, more concentrated condition. The thirtieth (centesimal) potency was the highest recommended by Hahnemann.

Burgersdicius, tr. by a Gentleman, I. xiv. 9.

II. *n.* **1.** Anything that may be possible; a possibility.—**2.** In *dynamics:* (*a*) The sum of the products of all the pairs of masses of a system, each product divided by the distance between the pair. The conception is due to Lagrange, the name to Green (1828) and independently to Gauss (1840). The *potential* is so called because its product by one constant differs only by another constant from the total *vis viva* of the system. In case there is but one attracting point, the potential is the sum of the masses, each divided by its distance from the point. (*b*) More generally, the line-integral of the attractions of a conservative system from a fixed configuration to its actual configuration; the work that would be done by a system of attracting and repelling masses (obeying the law of energy) in moving from situations infinitely remote from one another (or from any other fixed situations) to their actual situation. In this sense, the *potential* is the negative of the potential energy, to a constant *près*. But some writers limit the use of the word to the case in which the bodies in $(s+1)$-dimensional space attract one another inversely as the sth power of the distance. (*c*) In *electrostatics*, at any point near or within an electrified body, the quantity of work necessary to bring a unit of positive electricity from an infinite distance to that point, the given distribution of electricity remaining unaltered. See *equipotential*. (*d*) A scalar quantity distributed through space in such a way that its slope represents a given vector quantity distributed through space.—**Difference of potentials.** See *difference*.—**Logarithmic potential,** the potential for a force varying inversely as the distance. It is proportional to the logarithm of the distance, and is important in reference to the theory of functions.—**Magnetic potential,** at any point in a magnetic field, the quantity of work expended in bringing a positive unit magnetic pole from a given distance to that point.—**Newtonian potential.** See *Newtonian*.—**Potential difference.** Same as *difference of potentials* (which see, under *difference*).—**Potential of dilatation,** the function whose partial differential coefficients are the components of a dilatation.—**Velocity potential,** a scalar quantity such that the velocity of a mass of fluid in irrotational motion is everywhere equal to the slope of this quantity—that is to say, coincides in direction and in amount with the most rapid change of the value of the potential with the space. See *slope*.—**Zero potential,** in *elect.*, strictly, the potential of a point infinitely distant from all electrified bodies; practically, the potential of the earth, this being taken as an arbitrary zero, analogous to the sea-level in measuring altitudes. A body which is positively electrified is said to be at a higher potential, one negatively electrified at a lower, than the assumed zero of the earth. *Potential* in electricity is analogous to *temperature*; and, as heat tends to pass from a point at a higher to one at a lower temperature, so electricity tends to move from a higher to a lower potential. Two bodies, then, one or both of which are electrified, if brought into metallic connection with each other, will assume the same potential, which will be determined by their original potential and their capacity. (See *capacity*.) The time necessary for this equalization of potential will depend on the resistance of the connecting conductor. Thus, an electrified body connected with the earth loses its electricity—that is, takes the zero potential of the latter—the capacity of the earth being indefinitely great. If the difference of potentials between two connected bodies is kept up in any way—by the expenditure of mechanical work as in turning a Holtz machine, or of chemical energy as in a voltaic battery—there results an electric current. Hence, in *electrokinetics*, the difference of potential determines the electromotive force of the electric current, being analogous to the difference of level between two reservoirs of water, which determines the pressure causing the flow.

potentiality (pō-ten-shi-al'i-ti), *n.*; pl. *potentialities* (-tiz). [< F. *potentialité* = Sp. *potencialidad* = It. *potenzialità*, < LL. **potentialita(t-)s*, < **potentialis*, potential: see *potential*.] **1.** The state of being potential; mere being without actualization; the state of being capable of development into actuality: as, to exist in *potentiality*: opposed to *entelechy*.—**2.** A potential state, quality, or relation; the inherent capability of developing some actual state or quality; possibility of development in some particular direction; capability; possibility.

3. A potential being; a being, or capacity for existence, not yet actualized, but which may be developed into actuality.

Potentilla (pō-ten-til′ä), *n.* [NL. (Linnæus, 1735), so called in allusion to the repute of some species in medieval medicine; < L. *poten(t-)s*, potent: see *potent*.] **1.** A large genus of rosaceous plants, type of the tribe *Potentilleæ*, characterized by the numerous pistils on the dry receptacle, styles not lengthened after flowering, four or five bracts below the calyx, and many stamens in a single row. The number of species recognized by recent authors is about 150, most common in temperate and cold northern regions, only two being as yet known south of the equator. They are herbs or undershrubs, with mainly alternate pinnate or palmate leaves, adnate stipules, and usually white or yellow, often clustered, flowers. Several species are frequently called *wild strawberry*, as *P. Canadensis* in the Atlantic States and *P. sterilis* in England, but, while they are often very much like the true strawberry, *Fragaria*, in habit, the latter is always different in its fleshy receptacle. (See *cinquefoil* and *fivefinger*, 1.) Many brilliant-flowered species are occasional in cultivation, under the name *potentilla*. *Argentina Anserina* (*Potentilla Anserina* of Linnæus) is called in England *goose-tansy*, *wild tansy*, *goose-grass*, and *silverweed*. See *tormentil* and *bloodroot*, 1.

It contains 14 genera, mainly of temperate regions, both herbs and shrubs, generally without petals, producing a dry fruit resembling a rose-hip in structure, and having the five-lobed calyx provided with alternate bractlets. See *Poterium*.

There are about 20 species, natives of north temperate and warm regions. They are leafy perennial herbs, erect from a decumbent base, rarely becoming spiny shrubs. The pinnate leaves are alternate, with long sheathing petioles and toothed and stalked leaflets. The small perfect or polygamodiœcious flowers are borne in dense heads or spikes on long peduncles, and are green, purplish, pink, or white, conspicuous chiefly for the several or numerous slender stamens. *Sanguisorba Sanguisorba* is the common burnet. potestas (pō-tes′tas), *n.* [L., power: see *potestate*.] In *Rom. antiq.*, personal sovereignty or dominion of a man over persons dependent on him; the authority which the head of a household possessed over wife, descendants, and slaves, as distinguished from official authority, called *imperium*; more specifically, such personal authority over children and descendants as members of the household (*patria potestas*, which see) and over slaves (*dominica potestas*, also called *dominium*), as distinguished from authority over a wife, called *manus*. The conception of *potestas* is substantially that of the patriarchal authority—consisting of the aggregate of the powers of punishment even to death, of control, and of disposal—which in early times the chief of the household has generally been allowed to exercise, the ground of this authority being connected with the fact that retributive justice dealt rather with the family than with individuals, and held the chief responsible for offenses committed by members of the household, and did not interfere with him in his discipline. Hence, *potestas* was often used as the equivalent of *jus* or right, those who were subject to it being said to be *alieni juris*, or under the right of another, and those who were not subject to it *sui juris*, or living in their own right.

A group of pot-holes, some of which are of great size, is one of the curiosities of Lucerne in Switzerland (the "Glacier Garden"), where they appear to have been made at the time of the former greater extension of the glaciers in the Alpine range: also called *giants' kettles*. When grown under glass, they often adhere, perfectly flat, to damp vertical wooden surfaces, forming a sinuous upward line with the leaves facing the horizon. The leaves are two-ranked, oblique, and usually ovate or narrower, sometimes replaced by a broad leaf-like petiole (phyllodium). pot[1].] 1. The ware or vessels made by potters; baked earthenware, glazed or unglazed. —2. A place where earthen vessels are made. —3. The business of a potter; the manufacture of earthenware.—**Abruzzi pottery,** a name given to the decorative potteries made in the provinces of Abruzzi in Italy. The traditions of the majolica decoration lingered long in this region, although gradually modified. The most important of these wares are known by the name of *Castelli pottery.*—**Amstel pottery,** a common name for the decorative enameled pottery of Amsterdam, perhaps from the river Amstel, on which many of the furnaces were situated, but also by confusion with *Amstel porcelain.*—**Anatolian pottery.** See *Anatolian.*—**Apulian pottery.** See *Apulian.*—**Assyrian pottery,** the pottery found in the ruins of Assyrian antiquity. Its most important forms are—(*a*) architectural tiles and bricks, which are frequently decorated with enamel of the most brilliant colors, and arranged to form simple or elaborate designs, and sometimes painted with engobes, the bricks of each of these two kinds being frequently molded in relief; (*b*) cylinders, prisms, and so-called barrels, all intended to receive inscriptions which are impressed upon them; (*c*) flat tablets or tiles inscribed in the same way, and stored together in immense collections, forming libraries or collections of records, according to their subjects; (*d*) vessels for various uses—not generally rich in decoration, and for the most part of plain unglazed clay.—**Awata pottery.** Same as *Awata ware.* See *ware.*—**Bendigo pottery,** pottery made by the Bendigo Pottery Company at Epsom, near Sandhurst, in Victoria, Australia. It has a coarse body; but the surface is modeled in relief with flowers, etc., in a partial imitation of majolica.—**Bizen pottery,** pottery made in the Japanese province of Bizen; especially, a fine and hard pottery, unglazed or having a slight vitrification of the surface the nature of which is uncertain. It is of several colors, most commonly a reddish brown. Figures, bottles, etc., are made of this ware, generally well modeled and spirited.—**Broussa pottery,** pottery with a coarse and soft brown paste and white enamel, made at Broussa or Brusa in Asia Minor. It is generally decorated in a style similar to the Persian or Rhodian ware, and is used especially for wall-tiles.—**Burslem pottery,** pottery made at Burslem in Staffordshire, of which there are many varieties, made by many different potters from the seventeenth century to the present day. The name is sometimes used for the early work of the Wedgwoods, especially that made by Thomas and John Wedgwood from about 1740 to 1770, and also the earliest work of Josiah Wedgwood, before his removal to the Etruria works.—**Cambrian pottery.** See *Cambrian.*—**Castelli pottery.** See *Abruzzi pottery.*—**Celtic pottery,** pottery found in northern Europe in burial-places and occasionally among ruins, evidently pre-Roman in character, and supposed to belong to times before the Roman domination in Gaul, Britain, and elsewhere. Among the most common forms are large jars used as cinerary urns; but utensils of many kinds are also found. This pottery is usually soft, fragile, and gray or black in color.—**Chartreuse pottery.** See *Chartreuse.*—**Cognac pottery,** a decorative enameled pottery made at Cognac in France at the beginning of the nineteenth century. It seems to have been generally similar to the pottery of Nevers.—**Corean, Corinthian, Cypriote,** etc., **pottery.** See the adjectives.—**Damascus pottery,** enameled pottery decorated with conventional flowers, scrolls, etc., made in various parts of the Levant, and known otherwise as Rhodian, Anatolian, Lindus, and Persian. An attempt has been made to discriminate between these, and to class as Damascus only the finer pieces having a very even surface and more subdued coloring.—**Dresden pottery,** a name given to the fine pottery made by Böttcher before his discovery of porcelain. See *Böttcher ware,* under *ware*[2].—**Etruscan, Etrusco-Campanian, German pottery.** See the adjectives.—**Faenza pottery,** a variety of the Italian enameled and decorated pottery known as *majolica,* made at the town of Faenza in the province of Ravenna in Italy. In this place decorated pottery was made at a very early epoch; in the fifteenth and sixteenth centuries several important establishments existed there, and the amount of work done was very great. A distinguishing mark of the arabesque decoration of Faenza is the dark-blue ground, upon which the scrolls are often in yellow or orange. Faenza ware is generally decorated at the back, especially with an imbricated pattern, or still more simply with concentric circles.—**Hard pottery,** a name given to all manufactures of baked clay which are not translucent and are hard enough not to be scratched by an iron point. [This definition includes stoneware, which, however, is by some writers separated from pottery to constitute a third class, between pottery and porcelain. See *stoneware.*]—**Inlaid pottery,** a name given to the few varieties of decorated pottery in which the design is produced by cut-out patterns either incised in the surface of the paste or cut through the enamel to the paste beneath, which patterns are then filled up with clay of a different color. The earthenware tiles of the European middle ages, inlaid in red, yellow, and black, are an instance of this. The most remarkable is the Oiron ware. See cut under *biberon.*—**Mexican, Moorish, nonesuch pottery.** See the qualifying words.—**Nuremberg pottery,** pottery made at Nuremberg in Bavaria, a town which has always been a center of the potters' art. The most celebrated maker was Veit Hirschvogel, who was working in 1470, and after him his son Augustin, until 1560. The most important works of these and other potters of their time are tiles or panels with figures in relief, hand-modeled in fine clay, hard and thickly enameled, and colored dark-green, yellow, or brown.—**Palissy pottery.** (*a*) Decorative pottery made by Bernard Palissy in the sixteenth century, and from his molds or his designs after his death. Palissy's works were first at Saintes, near La Rochelle, and afterward at Paris, where the greater part of his finest productions were completed. The pottery by which he is best known has a hard paste and a rich glaze, decorated in many colors of great richness and depth. Some of his dishes, cups, and other pieces are pierced through, leaving an openwork pattern; some are decorated with marbled and jaspered surfaces, with moldings or marks in slight relief; and others are covered with lizards, serpents, fish, etc., modeled directly from life, and painted in close imitation of nature. (*b*) Imitations of the true Palissy ware, made by modern manufacturers, and often extremely successful, so as to be deceptive.—**Peasant pottery.** See *peasant.*—**Persian pottery,** pottery made in Persia, of several kinds, including an extremely hard and semi-translucent sort, which is probably an artificial porcelain. The ware commonly known as Persian is (*a*) a coarse brown paste with a white enamel, upon which flowers, scrolls, etc., are painted in vivid colors, and covered with a silicious glaze, and (*b*) a ware of similar composition with figures in relief and similarly decorated. Each of these two sorts has sometimes a copper luster, and it is not uncommon for pieces otherwise alike to differ in having more or less luster, so that it seems that the luster is not in all cases an important object with the decorator. Rhodian, Damascus, and Anatolian wares are often classed as Persian.—**Quimper pottery,** pottery made at Quimper, in the department of Finistère, France, especially enameled faïence made from 1690 and throughout the eighteenth century. The style of decoration is usually very similar to that of either Nevers or Rouen, according to the time.—**Rhodian pottery,** pottery made in the Isle of Rhodes. This pottery is similar in decoration to Persian and Damascus ware, but is distinguished from it by a somewhat bolder decoration and more brilliant colors, and by the more frequent use of enamel color put on so thickly as to remain in slight relief. In material and character, this ware is similar to the Persian. Also called *Lindus pottery,* from the town of Lindus, now called Lindo, a seaport of the isle.—**Roman pottery,** pottery made in the city of Rome since the tenth century; especially—(*a*) a variety of Italian majolica marked as being made in Rome, of which but few pieces are known to exist; and (*b*) a white-glazed earthenware, of which the factory was established by Volpato the engraver, about 1790, and was continued by his sons and others. Figures and groups were made of this ware. The color of the pieces varies from pure white through different shades of buff to a sort of stone-color.—**Rouen pottery,** pottery made at Rouen in Normandy, especially that made during the seventeenth century and later: an enameled faïence of excellent make and fine finish, and decorated generally in excellent taste, according to the style of the day. The chief varieties, considered with regard to the decoration, are—(*a*) that ornamented with scrolls and arabesques of grayish blue on a bluish-white ground, the ground thickly covered with the ornament, which is generally disposed with great skill, so as to be effective both near at hand and at a distance; (*b*) that painted in full color with bouquets and single flowers, and more rarely with figure-subjects in medallions, the ground of this variety being generally of a purer white; and (*c*) that in which the two preceding styles are mingled, the dark-blue scrolls alternating with bouquets and festoons in color, and the ground of the enamel bluish. There are also exceptional varieties, as that closely imitating Chinese painting on porcelain, and that in which carefully made white enameled pieces are decorated only by a cont of arms, or a device or emblem in imitation of an effective Italian style.—**Rough-cast pottery,** a pottery whose surface is roughened by being dusted, before being fired, with pottery either in small fragments or pounded fine, or with small bits of dry clay. In most cases the vessel is dipped in thin slip before being fired.—**Semi-porcelain pottery,** a name given to pottery of a fine body made at the Royal China Works at Worcester about 1850: an excellent ware for table-services and the like, hard, very perfectly vitrified, and white throughout the paste.—**Sèvres pottery,** pottery made at Sèvres near Paris—either (*a*) at the National Porcelain Factory, which at different epochs has produced a limited number of pieces of enameled faïence, or (*b*) at private factories, of which there have been a number at different times since about 1775. Compare *Sèvres porcelain,* under *porcelain*[1].—**Sicilian pottery,** a name given to certain varieties of lustered ware akin to the Hispano-Moresque, and with decoration frequently resembling Damascus pottery. The names *Siculo-Arabian* and *Siculo-Moresque* have been given to the above, and some attempt has been made to distinguish between these two alleged varieties. The pieces offered for sale in the towns of Sicily are roughly decorated in a style similar to that of the Italian peninsula.—**Soft pottery,** common pottery which is not hard-baked. The test is that it can be easily scratched with an iron point. All common flower-pots are of soft pottery; but there are many kinds of pottery much softer, some of which can be cut with a knife.—**Unglazed pottery,** earthenware made by modeling the vessel in clay, and firing it without the addition of a glaze. Ordinary flower-pots, terra-cotta, and common bricks are instances of unglazed pottery.—**Upchurch pottery,** a name given to the ancient pottery found in the Upchurch marshes in Kent, and also to that found elsewhere which appears to have come from that region. In a district five or six miles long many ancient kilns and immense quantities of this pottery have been found. The ware is gray or black, more rarely brownish-red, generally thin, and well made. It is undoubtedly of the Roman period.—**Varages pottery,** pottery made at Varages, in the department of Var, France, beginning about 1740. It is an enameled faïence whose decoration imitates that of other factories, especially that of Moustiers. There were many potters engaged in this manufacture, whose work it is not possible to distinguish. (See *thrown-ware.*)

Cf. *ponder, ponderous*, etc. *Pound*, as used in comp. in designating the sizes of nails, has suffered alteration to *penny:* see *penny*.] **1.** A fundamental unit of weight or mass. In the English system, both in the more antiquated form retained in the United States and under the improvements established by the British government, two pounds are used—the pound avoirdupois (divided into 16 ounces) for all ordinary commodities, and the troy pound (divided into 12 ounces) for bullion, and in the United States for a few other purposes. But, while troy ounces and their subdivisions are often used, the pound itself is hardly employed. In Great Britain and its colonies the legal original standard weight since 1856 has been the imperial pound avoirdupois, which is a cylindrical mass of platinum, having a groove round it near the top, and marked P. S. 1844 1lb. The letters P. S. stand for "Parliamentary Standard." The so-called "commercial pound" is only an ideal brass pound to be weighed in air. The troy pound in Great Britain is defined as 5,760 grains of which the avoirdupois pound contains 7,000. From 1824 to 1856 the only legal original standard weight in Great Britain was a troy pound constructed in 1758 and denominated the imperial standard troy pound; and the avoirdupois pound was defined as 7,000 grains of which the troy pound contained 5,760. The present imperial pound avoirdupois probably does not differ by $\frac{1}{7000}$ grain from the previous avoirdupois pound. Before 1824 the legal standards had been certain weights, both troy and avoirdupois, constructed under Queen Elizabeth in 1588. These standards had not been very accurately constructed, and became worn by continual use; but it is probable that the avoirdupois pound had been equal to 7,002 of our present grains, of which the troy pound may have contained 5,759. The two pounds were not supposed to be commensurable. The Elizabethan avoirdupois pound remains, in theory, the legal avoirdupois pound in the United States; but of late years the practice has been to copy the British imperial pound avoirdupois. Congress has made a certain pound-weight kept in Philadelphia the troy pound of the United States; but this is a hollow weight (and therefore of an inferior character, and such as no European nation would be content to take for a prototype), and consequently its buoyancy is uncertain, and its mass cannot be ascertained with great accuracy. Practically, the British troy pound is copied. The pound avoirdupois was made a standard by Edward III., according to official evidence. From his 56-pound weight Elizabeth's standards were copied, although standards had been made in 1497, direct copies from which still exist. The troy pound was the pound of the city of Troyes, where a great annual fair was held. In 1497 it was made the legal weight in England for gold and silver, and it was generally used for other costly things, such as silk. The old books say it was used for bread; but Kelly, writing before the abolition of the assize of bread, says the pound used for that purpose was one of 7,600 grains, which he calls "the old commercial weight of England." The monetary pound which the troy pound displaced had been used from Saxon times. It was equal to 5,400 or 5,420 of our present grains, and was divided into 12 ounces or 20 shillings. Contemporaneously with it there existed a merchants' pound containing 15 of the same ounces, making 6,775 grains. The avoirdupois and troy pounds are respectively about 453.6 and 373.26 grams. Other pounds have been in use in England. An act of 12 Charles II. legalizes the Venetian pound for weighing Venetian gold. This pound was a variation of the ancient Roman pound. The pound of Jersey and Guernsey was the French *poids de marc*. The Scottish Troyes or tron pound varied at different times, but latterly it was about 492 grams, being identical with the Dutch pound. Local pounds of 17, 18, 21, 22, and 24 ounces were in use until recently. Before the metric system, many hundreds of different pounds were in use in Europe, mostly divided into 16 ounces, but many into 12 ounces. The principal types were as follows. (1) Polish pounds, of values clustering about 405 grams, containing 16 ounces of about 25 grams each, from the old Warsaw pound of 378.8 grams to the old Cracow pound of 405.9 grams. The latest Polish pound was 405.504 grams. (2) The pounds of High Languedoc and the "table-weight" pounds of Provence, of values clustering about 410 grams, from the pound of Salon of 376.6 to that of Embrun of 435.0 grams. Some of the table pounds, as that of Ain (438.3 grams), were divided into 14 ounces; so the chocolate pound of Vienna had 28 loth, weighing 490 grams. Also, certain silk-pounds were divided into 15 ounces; but these were of greater weight. This was the case with the ordinary pound of Geneva of 458.9 grams, which was equal to the silk-pound of Lyons. The silk-pound of Patras in the Morea had also 15 ounces, but its value amounted to 480 grams. The 15-ounce merchants' pound of England of 437 grams had ounces of the same value as the old 12-ounce moneyers' pound of the Saxons. (3) Baltic pounds, of values clustering about 422 grams (making the ounce about 26¼ grams), from the Russian pound of 409.5174 grams to the Dantzic pound of 435.5 grams. The Swedish pound was 425.04 grams. (4) The Italian pounds, of values clustering about 326 grams (having 12 ounces of about 27 grams each), the great majority between 300 and 350 grams. The following are examples:

	Grams.
Venice, light pound	301.29
Sicily	319.06
Naples, silk-pound	320.70
Milan, light pound	327.02
Rome	339.16
Tuscany	339.58
Piedmont	368.88
Ragusa, in Dalmatia	374.07
Venice, heavy pound	477.12

These pounds would seem to be mostly modifications of the ancient Roman pound, the value of which was, according to the extant standards, 325.8 grams, but according to the coins 327.4 grams. There were, however, anciently other widely different pounds in Italy, from which some of the modern Italian pounds may have been derived. Many of the Italian cities had light and heavy pounds, the latter belonging to the class of pounds about 490 grams, or being still larger and containing more than 16 ounces. (5) Light-weight pounds, having ounces of about 29 grams. These include Spanish and Portuguese pounds, mostly ranging from 458.5 to 460.5 grams, Netherlands pounds, ranging mostly from 463 to 470 grams, and German light-weight pounds, ranging mostly from 467 to 468.5 grams. The Saxon moneyers' pound comes into this category, being 350 grams, or 467 grams for 16 ounces. The avoirdupois pound of 453.6 grams is either a very light Spanish pound or a very heavy Provençal pound. The German pounds are divided not into 16 ounces but into 32 loth. Some of the Spanish pounds contain only 12 ounces, the ounce retaining the same value. The following are examples:

	Grams.
Portugal	459.00
Spain	460.14
Liège	467.09
Antwerp	470.17
Saxony	467.15
Prussia	467.7110
Würtemberg	467.75
Frankfort	467.88

(6) The German 12-ounce medicinal pounds, of values clustering about 358 grams (the ounce about 30), and mostly between 357 and 360. The Nuremberg pound, 357.854 grams, had much currency in different parts of Germany. (7) The heavy-weight pounds of France and Germany, of values clustering about 490 grams (making the ounce about 30¾ grams), being mostly included between 488½ and 498½ grams. But there were a few half-heavy pounds between the heavy and the light, having ounces of 29¾ grams. There were also a few extra-heavy, having ounces of 31¾ grams. The following are German examples:

	Grams.
Nuremberg, goldsmiths' (half-heavy)	477.138
Hamburg	484.12
Cassel	484.24
Lübeck	484.72
Hanover	489.57
Dutch troy	492.16772
Bremen	498.50
Denmark	499.26
Nuremberg, commer. (extra-heavy)	510.22

But the most important pound of this class was the French mark-weight pound, of 489.50585 grams. This unit was so called because it had double the mass of a certain nest of weights, called a *mark*, which had been preserved in the Paris mint with scrupulous care from time immemorial. There is evidence that Charlemagne, under whom Western medieval coinage commenced, used a 12-ounce pound, the *livre esterlin*, whose ounces agreed with those of the Paris mark. It is said that Haroun al Raschid sent a standard pound to Charlemagne, and it has commonly been inferred that the *livre esterlin* was conformed to that, especially as Queipo found an authentic rotl of the same weight. Rotls, however, are of almost all weights, and there is no sufficient evidence of what one Haroun would have sent; besides, the fact that he sent a weight to Charlemagne affords no reason for thinking that Charlemagne would adopt it. We know that Dagobert, 150 years before, had kept a standard of weight in his palace, and it is quite likely that Charlemagne continued the use of that. Indeed, he had neither motive nor power to change the customary weight, such changes being effected only by changes in the course of commerce or by the hands of strong governments. (8) The South German pounds, of values clustering about 560 grams (making the ounce about 35 grams), from that of Fiume, in Croatia, of 558.7 to that of Münster of 576.4 grams. The Bavarian and Vienna commercial pounds were, by law, 560 grams. Besides the pounds above mentioned, there were some containing more than 16 ounces. The heavy pounds of Valencia (524.4 grams), Zürich (528.6), and Geneva (550.6) had 18 ounces. There is said to have been a heavy pound (575 grams) in the Swiss canton of Schaffhausen, having 20 ounces. The commercial pound of the Asturias, equal to 690.1 grams, seems to have been divided into 24 ounces. The heavy pound of Milan of 763.13 grams had 28 ounces, that of Bergamo (815.2 grams) 30 ounces, and the meat-pound of Valencia (1069 grams) 36 ounces. See *mark*[2], *mina*[1], *rotl*.

2. A money of account, consisting of 20 shillings, or 240 pence, originally equivalent to a pound weight of silver (or of the alloy used). It is usually discriminated from the pound weight by the epithet *sterling*. The pound Scots was equal to a twelfth

only of the pound sterling; it also was divided into 20 shillings, the shilling being worth only an English penny. In the currency of the American colonies the pound had different values: in New England and Virginia it was equal at the time of the Revolution to 15*s.* sterling, or $3.33⅓; in New York and North Carolina, to 11*s.* 3*d.* sterling, or $2.50; in New Jersey, Pennsylvania, Delaware, and Maryland, to 12*s.*, or $2.66⅔; in Georgia, to 18*s.*, or $4.00. These units of value did not at once disappear from local use on the adoption of the decimal system of coinage by the United States.

B. Jonson, Apol. to Poetaster.

practisour†, *n.* A Middle English form of *practiser.*

practitioner (prak-tish'on-ėr), *n.* [Formerly *practicioner* for **practicianer,* < *practician* + *-er*[1] (the suffix unnecessarily added, as in *musician-er*, etc.).] **1.** A practiser; one who acquires knowledge from actual practice; one who has practical experience.

He that would be a *practitioner* in those affaires I hope will allow them not only needfull but expedient.
Capt. John Smith, Works, II. 252.

Believe an old *practitioner*, whoever out of malice to a fellow servant carries a tale to his master shall be ruined by a general confederacy against him.
Swift, Directions to Servants in General.

2. One who is engaged in the actual practice or exercise of any art or profession, as law or medicine.

There are several Fictions still exercising powerful influence on English jurisprudence which could not be discarded without a severe shock to the ideas, and considerable change in the language, of English *practitioners*.
Maine, Ancient Law, p. 27.

The surgeon who has not sufficient courage to propose a useful operation, and sufficient skill to perform it, is as open to censure as the reckless *practitioner* who is swayed by the unworthy lure of notoriety.
J. M. Carnochan, Operative Surgery, Pref., p. iii.

3†. One who uses schemes or artifices; a plotter; a conspirator.

There are some papistical *practitioners* among you.
Abp. Whitgift.

General practitioner, one who practises both medicine and surgery. Formerly in England the general practitioner, also called *surgeon apothecary* or *apothecary*, was the ordinary family medical attendant, supplying drugs as well as advice to his patients. He was licensed to practise by the Apothecaries' Company (incorporated 1617), and was in rank below the physician or surgeon. This distinction is now passing away, and the word *general practitioner* may be applied, as in the United States, to a physician who practises also surgery and obstetrics. See *apothecary.*

It was clear that Lydgate, by not dispensing drugs, intended to cast imputations on his equals, and also to obscure the limit between his own rank as a *general practitioner* and that of the physicians who, in the interests of the profession, felt bound to maintain its various grades.
George Eliot, Middlemarch, ii. 18.

for which it is granted, or the penalty incurred. Originally the offense contemplated was the introduction of a foreign power into the kingdom. Whenever it is said that a person by any act incurs a *præmunire*, it is meant to express that he thereby incurs the penalty of being out of the crown's protection, of having his lands and tenements, goods and chattels, forfeited to the crown, and his body remain in prison during the sovereign's pleasure. This penalty attached in former times to the offenses of asserting the jurisdiction of the Pope, especially by impleading other subjects in foreign ecclesiastical courts, and denying the sovereign's supremacy. By later statutes, acts of a very miscellaneous nature have been rendered liable to the penalties of præmunire, as refusing to take the oaths of allegiance and supremacy.

He [Henry VIII.] saw that the *Præmunire* made him absolutely master of the clergy, and, as absolute master, the primary owner of all Church property.

Lastly, it became the name for an arrangement or family compact, made by different potentates, regarding succession to sovereignty—the most noted being the instrument by which the emperor Charles VI., being without male issue, endeavored to secure the succession to his female descendants, settling his dominions on his daughter Maria Theresa.

Prairial (prā′ri-al), *n.* [F., < *prairie*, a meadow: see *prairie*.] The ninth month in the French revolutionary calendar. In the year 1794 it began May 20th and ended June 18th.

★**prairie** (prā′ri), *n.* [< F. *prairie* = Pr. *pradaria* = Sp. *pradera*, *praderia* = Pg. *praderia* = It. *prateria*, a meadow, < ML. *prataria*, meadowland, prop. fem. of *pratarius*, adj., < L. *pratum*, a meadow. Cf. *prayere*, *prayell*.] A meadow; level grassy land: a word frequently used by Hennepin and other French writers in describing the country adjacent to the Mississippi river, and now in common use, designating the level or slightly undulating treeless areas which cover a large part of Illinois, Wisconsin, Iowa, Minnesota, and other States further south. The prairies are never by the inhabitants of the prairie regions called *plains*, as are the treeless regions further west. They are characterized by a highly fertile soil, often of great thickness, and they often occur where the rainfall is even considerably larger than on parts of the adjacent forest-covered regions. The cause of the absence of trees upon them cannot, therefore, be deficiency of moisture; in all probability it is the physical character of the soil, and especially its extreme fineness, which renders it more suitable for the growth of the grasses than for that of arboreal vegetation. Fires, either intentionally set by the Indians or due to natural causes, are believed to have aided in keeping down the tree-growth where it might have otherwise extended. In the extreme northwestern region of the United States, especially in Montana, certain level treeless areas surrounded by the mountains are now by some called *prairies*: some of these had been previously denominated *holes*. Farther south in the Rocky Mountains they are known as *parks*, or sometimes as *basins*. See *hole*[1], 6, and *plain*[1].

The *prairie* alluded to was one of those small natural meadows, or pastures, that are to be found in Michigan, and may have contained four or five thousand acres of open land.
Cooper, Oak Openings, i.

In general, however, the term *prairie* is used to designate tracts of land nearly or quite destitute of forests, or over which the trees are, as a general rule, limited to the "bluffs"—the more or less precipitous slopes which separate the upland, or prairie proper, from the river bottom.

The name *Tympanuchus*, or *Cupidonia*, *cupido* was originally applied to eastern birds, now regarded as a distinct species, and exterminated except possibly on Martha's Vineyard. 6. That part of a memorial or petition to a public body, or of a bill of complaint in equity, which specifies the thing desired to be done or granted, as distinct from the recital of facts or reasons for the grant.—**Apostleship of prayer.** See *apostleship*.—**Book of Common Prayer**, the book containing the appointed forms for public worship and for the words and acts used in the rites and ceremonies of the Church of England, or a similar book authorized by one of the other branches of the Anglican Church: briefly and popularly known as the *Prayer-book*. After the publication in English of the Litany in 1544, and of the parts of the communion office relating to the communion of the people in 1548, the First Book of Common Prayer was issued in 1549, the second year of Edward VI. Almost the whole book is taken from the medieval liturgical books, especially the missal, portiforium (breviary), and manual according to the Use of Sarum (see *use*), but with omissions, condensations, and the addition of a number of addresses to the people. English was substituted for Latin, all the offices were united in one book, and a uniform use was established for the whole Church of England. Successive revisions were made in 1552, 1559, and 1662. The greatest changes were those introduced in the Second Prayer-book of Edward VI. (1552), especially in the communion office (see *communion*) and at confirmation and burial. This book never came into actual use, but was in the main followed in the revision under Elizabeth in 1559 and in the present English book as issued in 1662, after the restoration of Charles II., but with material modifications, especially in 1662, returning toward the standard of 1549. The Prayer-book authorized in 1637 for use in Scotland, and differing from the English book mainly in the communion office, met with serious opposition at the time, but came into use afterward in the Scotch Episcopal Church. The American Prayer-book, authorized in 1789, differs from the English mainly in the omission of the Athanasian Creed and of the form of private absolution in the visitation of the sick, the restoration of the great oblation and invocation to their primitive places in the prayer of consecration (see *consecration*), and the later addition of the offices of consecration of churches and institution of ministers. In 1880 a new revision was begun, resulting chiefly in a return to the English book in several points: this revision was completed in 1892. The Psalter, Ordinal, and Thirty-nine Articles are always bound with the Book of Common Prayer, and usually considered parts of it,

though technically speaking they are distinct from it. —**Commendatory, common, Lord's, passive,** etc., **prayer.** See the qualifying words.—**Hours of prayer.** Same as *canonical hours* (which see, under *canonical*).—**House of prayer.** See *house of God*, under *house*[1].—**Prayer of humble access.** See *access*.—**The long prayer,** in non-liturgical churches, the chief prayer of the service. It is usually offered just before the sermon, or before the hymn preparatory to the sermon. Also called *pastoral prayer*.—**To lead in prayer.** See *lead*[1]. =**Syn.** *Prayer, Petition, Request, Entreaty, Supplication, Suit, Appeal*, invocation, orison. *Prayer* is always addressed to God, but *a prayer* may be addressed to a sovereign, legislative body, court, or the like, always to a person or body recognized as having authority in some way, and asking for something especially important. A *petition* may be a single point in a *prayer:* thus, the Lord's *Prayer* contains one address, three loyal desires, four *petitions*, and a closing ascription. A *petition* may also be a formal and public *request* or *prayer*, but still generally covering only a single thing desired. *Request* is the most general and least forcible of these words, indicating nothing as to the degree of formality of the act or as to the rank of the persons concerned. An *entreaty* is an urgent, perhaps tender, request, generally from and to a person. A *supplication* is still more urgent, the request being made with passion, and humbly, as to a superior. The word *entreaty* is not often followed by the mention of that which is desired, but may be: as, *entreaty* for aid. A *suit* is a petition or an entreaty prolonged for any reason: hence we speak of a lover's *suit* or a *suit* at law. An *appeal* is an urgent request, of the nature of a call or demand. See *ask*[1].

This prefix occurs disguised or absorbed in *preach, premium, prey*[2], *prison, prize*[1], etc., and as *pro-* in *provand, provender, provost*, etc.] A prefix in words of Latin origin, meaning 'before,' in place, time, or rank. By reason of its great frequency in compounds of Latin origin or formation, it has been used and felt as an English formative, whether with words of Latin or Greek origin, as in *preact, prehistoric*, etc., or with other words, as in *pre*raphaelite, *pre*adamite, etc., though rarely with native English verbs, as in *pre-look*. In zoology *pre-* (or *præ-*) is a frequent prefix, used almost at will, indicating precedence, whether in time or place; it is quite synonymous with *ante-*, and to some extent with *pro-* or *proto-*, and is opposed to *post-* or *meta-* in any sense. In recent technical terms it is often in the Latin form *præ-*, such words, whether Latin or English in termination, having *pre-* or *præ-* almost indifferently. Strictly, in all such words having a Latin termination the prefix should be *præ-*; in words fully Englished, the form *pre-* is to be used. It is sometimes interchanged with *pro-*.

Order of precedence, the whole body of rules which fix gradation of rank, especially with regard to the right of certain officials and persons of rank to a prescribed place in any ceremony. This phenomenon is caused by the combined action of the sun and moon on the mass of matter accumulated about the earth's equator, and is called the precession of the equinoxes because it makes the equinoxes succeed each other in less time than they would otherwise do. In consequence of the precession of the equinoxes, the longitudes of the heavenly bodies are continually increasing, the latitudes remaining unchanged. The right ascensions and declinations are, of course, both changing. The precession of the equinoxes was discovered by Hipparchus more than a century before the Christian era. The harshness of the doctrine of occasional contraband brought into favor the rule of *preëmption*, which was a sort of compromise between the belligerents (if masters of the sea) and the neutrals. The former claimed that such articles may be confiscated, the latter that they should go free. Now, as the belligerent often wanted these articles, and at least could hurt his enemy by forestalling them, it came nearest to suiting both parties if, when they were intercepted on the ocean, the neutral was compensated by the payment of the market price and of a fair profit. *Woolsey*, Introd. to Inter. Law, § 182.

Clause of preëmption, in *Scots law*, a clause sometimes inserted in a feu-right, stipulating that if the vassal shall be inclined to sell the lands he shall give the superior the first offer, or that the superior shall have the lands at a certain price fixed in the clause.—**Preëmption Laws**, United States statutes of 1830, 1832, 1833 (4 Stat. 420, 603, 663), 1838, 1840, and 1841 (5 Stat. 251, 382, 453, consolidated in Rev. is usually confined to particulars relating to the origin, history, scope, or aim of the work to which it is prefixed.

2. [*cap.* or *l. c.*] In *liturgics*, the introductory section of the anaphora; the solemn eucharistic thanksgiving and ascription of glory introducing the canon. The Preface is found of the same type in all liturgies. It begins with the Sursum Corda, generally preceded in early and Oriental forms by the apostolic (2 Cor. xiii. 14) or a similar benediction. After an exhortation to give thanks (Response: "It is meet and right . . ."), the Preface in the narrower sense begins with the affirmation (contestation) "It is very [truly] meet, etc., to give thanks . . ." The reason for thankfulness is given in the central division of the form. This in early and Oriental liturgies is invariable, and still retains much of its original character of an extended ascription of glory to God and rehearsal of his dealings with man from the Creation and Fall onward. In Western liturgies a number of *proper Prefaces* is provided, varying according to the day or season. Probably these were originally sections of the primitive Preface or of the earlier part of the Canon, selected as appropriate to the season or modeled on such sections. The Preface terminates with the Sanctus. Also, in Gallican uses, *contestation*, *illation*, *immolation*.

II. *intrans.* To state premises; preface an argument or other discourse with premises.

I must *premise* with three circumstances. *Swift*.

premiss, *n.* See *premise*.

Cf. *admit*, *commit*, *demit*, etc. Hence (< L. *præmittere*) ult. E. *premise*, *n.*, *premise*, *v.*, etc.] To premise.

He doth, in this and the next verse, *premit* a general doctrine thereunto.
Hutcheson, On John, p. 299. (*Jamieson*.)

★**premium** (prē'mi-um), *n.* [Early mod. E. *premye* (q. v.), < OF. *premie* = Sp. Pg. It. *premio*, reward, premium; < L. *præmium*, profit derived from booty, booty, game, prey; in general (the usual sense), profit, advantage, and in particular, reward, recompense; contr. of **præimium*, < *præ*, before, + *emere*, take, buy: see *emption*, etc.] 1. A reward; a recompense given for a particular action or line of conduct. Specifically—(*a*) A prize to be won by competition. (*b*) A bonus; an extra sum paid as an incentive; anything given as an inducement. (*c*) A fee paid for the privilege of being taught a trade or profession.

2. That which is given for the loan of money; interest.

Men never fail to bring in their money upon a land-tax when the *premium* or interest allowed them is suited to the hazard they run. *Addison*, Freeholder, No. 20.

3. In *insurance*, the amount paid or agreed to be paid in one sum or periodically to insurers as the consideration for a contract of insurance. See *insurance*, 2.—**4.** In *banking* and *currency*, the difference by which the value of one metallic currency exceeds that of another of the same denomination, or by which a metallic currency exceeds a paper currency of the same denomination in the same country; agio: the opposite of *discount*, or *disagio*, which is the amount by which the value of one currency has depreciated when compared with another. Thus, during the civil war in the United States, when $125 in paper currency was demanded for $100 in gold, the gold dollar was said to be *at a premium* of 25, as compared with paper, but it might more correctly be said that paper was *at a discount* of 20 per cent. as compared with gold.

5. In *stock-broking*, etc., the percentage of difference by which the market price of shares, stocks, bonds, etc., exceeds their face-value or the sum originally paid for them: thus, when stock originally issued at $100 per share sells at $140 per share, it is said to be *at a premium* of 40 per cent.—**At a premium**, above par; at a higher price than the original cost or normal value; hence, difficult to obtain; rare and valuable.—**Premium note**, a note given in place of payment of the whole or a part of an insurance premium.

Premna (prem'nä), *n.* [NL. (Linnæus, 1771), so called in allusion to the short stem or low tree-trunk; < Gr. πρέμνον, a stump.] A genus of sympetalous shrubs and trees of the family *Verbenaceæ* and tribe *Viticeæ*. It is characterized by the four didynamous stamens included within the short, small, and nearly equally four-lobed corolla, and by the single four-celled drupe. There are about 40 species, natives of warm regions of the Old World. They bear opposite entire or toothed leaves and rather loose cymes of white or bluish flowers, in panicles or corymbs, or condensed into an elongated pyramidal inflorescence. *P. Taitensis* of the Fiji Islands, etc., there called *yaro*, affords wood for building, and its bark enters into the drug tonga. See *headache-tree* and *tonga*.

II. *n.* A tooth which in the permanent dentition replaces a milk-molar. Such teeth occur as a rule in mammals which have a diphyodont dentition. All the molars or grinders of the first set are technically milk-molars, those which succeed and replace them in the second set being premolars, whatever their size, form, or number. They are usually smaller than true molars, and also less complicated in structure; but such distinctions do not hold in every case. Premolars are developed in an anterior part of the maxillary bone, and, when they coexist with true molars, are always situated in front of the latter. The first, foremost, or most anterior premolar is much the smallest of the series and usually has but a single root. The typical though not the most frequent number of premolars is four above and below on each side; there are rarely more than three, oftenest two, as in man; sometimes one or none, as in rodents. The two premolars of man are commonly called *bicuspids*. In dental formulæ the symbol of *premolar* is *pm* or *p*. The premolar formula of man is $pm.\ \frac{2-2}{2-2}$.

It followeth . . . that no words or writings are of certain truth upon any account of God's inspiration or *premotion*, because God not only can, but doth, cause all the untruths that are spoken or written in the world: therefore no faith in God's revelation hath any sure foundation, . . . and so all religion is dashed out at a stroke.
Baxter, Divine Life, i. 19.

Many Jesuit writers of note differ from Molina in almost all, save the one essential point of making the human will "a faculty that, even when all conditions of activity are present, is free either to act as it chooses or not to act at all." But this thesis is nothing more than the mere denial of "physical *premotion*." *Mind*, XII. 266.

In Mr. Arthur Helps' . . . "In Memoriam" in this month's "Macmillan," speaking of Charles Dickens's more than punctuality, he has happily described the quality by so characteristic a term, *prepunctuality*, that the word must henceforth assume a recognized place in our language. *N. and Q.*, 4th ser., VI. 25.

Preputial crypts, follicles, or **glands**, small lenticular sebaceous glands situated upon the corona glandis and cervix of the penis, secreting the smegma. Also called *glands of Tyson* and *odoriferous glands*. The corresponding structures of some animals are highly developed, and yield commercial products, as musk and castoreum.

Every *Pre-Raphaelite* landscape background is painted to the last touch, in the open air, from the thing itself.
Ruskin, Lects. on Architecture and Painting, iv.

The *Pre-Raphaelite* movement is understood to have combined two very distinct aims: first, the intellectual elevation of art by the choice of noble and original subjects, and, secondly, its technical advancement by a new and minute analysis of nature.
P. G. Hamerton, Thoughts about Art, xiii.

II. *n.* One who practises or favors Preraphaelitism in art or poetry.

The essential characteristic of the revived style is rigid adherence to natural form and effect, and consequent rejection of all effort to elevate or heighten the effect artificially, by modifications, whether in drawing, arrangement, or coloring, based on conventional rules. The name is also given to the application of similar principles in poetical composition, shown in attention to minute details.

Pre-Raphaelitism has but one principle, that of absolute uncompromising truth in all that it does, obtained by working everything, down to the most minute detail, from nature, and from nature only.
Ruskin, Lects. on Architecture and Painting, iv.

If *Preraphaelitism* is to be judged by its chief exponents, it will be seen to be primarily a protest, and not in itself a fixed creed. *W. Sharp*, D. G. Rossetti, p. 61.

The father and mother of modern *Pre-Raphaelitism* were modern literary thought and modern scientific investigation of the facts of nature.

The word is specially used to note the various religious bodies which adopt the Presbyterian form of church government (see *Presbyterianism*), and hold a more or less modified form of Calvinism. Among the leading Presbyterian churches are the following: (1) The established Church of Scotland, formed in 1560 under the leadership of Knox; it prepared the First Book of Discipline in 1560, the Second Book of Discipline in 1581, and was formally established by the government in 1592. It was temporarily replaced by episcopacy during the period 1661–89. Later events were secessions leading to the formation of various bodies in the eighteenth century (Secession Church in 1733, Relief Church in 1761) and of the Free Church in 1843. See *Covenanter*, 2. (2) The Presbyterian Church in the United States of America. Its first presbytery was founded in 1705. After a temporary disruption, the first General Assembly met in 1789. In 1838 the church split on theology and the antislavery question. (See *New School*, *Old School*.) The two wings were reunited in 1870. It numbers about 1,400,000 members. (3) The Presbyterian Church in the United States (Southern). This body seceded from the Old School Presbyterian Church in 1861 on the establishment of the Confederacy, and during the period 1861–5 it had the title of General Assembly of the Confederate States of America. It numbers about 300,000 members. Other bodies, besides the Free Church of Scotland (see *free*), and those mentioned below, are the Reformed Presbyterian Churches in the United States, the Welsh Presbyterian Church, the Presbyterian Churches of England, Canada, Ireland, etc. —**Cumberland Presbyterian Church**, a Presbyterian body which seceded from the Presbyterian Church in the United States, and was developed from the Cumberland presbytery in Kentucky and Tennessee in 1810. It was reunited May 24, 1906.—**New School Presbyterian Church**, that wing of the Presbyterian Church in the United States which in 1838 separated from the other branch. It held pronounced views against slavery, and was regarded as less conservative in theology.—**Old School Presbyterian Church**, that wing of the Presbyterian Church in the United States which held more conservative views regarding slavery and Calvinism. The Southern Presbyterian Church seceded from it in 1861, and the remainder united with the New School Presbyterians in 1870.—**Reformed Presbyterian Church.** See *Cameronian*, *n.*, 1, and *Covenanter*, 2.—**United Presbyterian Church.** (*a*) A Scottish church formed by the union of the United Secession Church and the Relief Church (see above) in 1847. In 1900 it united with the majority of the Free Church of Scotland to form the United Free Church of Scotland. (*b*) A church in the United States formed in 1858 by the coalition of various bodies. It numbers over 136,000 members.

Presbyterianism (pres-bi-tē'ri-an-izm), *n.* [= F. *presbytérianisme* = Sp. *presbiterianismo* = Pg. *presbyterianismo*; as *Presbyterian* + *-ism.*] The system of church government by elders or by presbyteries. The essential features of church government in Presbyterianism are—the equality of the clergy, the identification of the apostolic presbyter with the bishop, the division of elders into teaching elders (or ministers) and ruling or lay elders, the government of each local church by its session, composed of pastor and ruling elders, and the subordination of sessions to a presbytery, of presbyteries to a synod, and of synods to a general assembly. In the Dutch Reformed Church, which adopts Presbyterianism, the bodies corresponding to session, presbytery, synod, and general assembly are consistory, classis, synod, and general synod. This system of church government is opposed to episcopacy on one side and to congregationalism and independency on the other. It was developed in the sixteenth century by Calvin and other reformers, and was adopted in Geneva and by the reformers in France, Scotland, etc. It supplanted episcopacy for a short time in England, in the period of the Civil War and Commonwealth. Presbyterianism is the predominating form of church government in Scotland, and prevails extensively in the Netherlands, in the United States, and in Ireland and other parts of the British empire.

Doctrine of the real presence, the doctrine that the body and blood of Christ are present in the eucharist. This view is held by the Roman Catholic and Greek Churches, and in a modified form by the Anglican Church. The Roman Catholic position is thus defined: "In the august sacrament of the holy Eucharist, after the consecration of the bread and wine, our Lord Jesus Christ, true God and man, is truly, really, and substantially contained under the species of those sensible things." (*Canons and Decrees of the Council of Trent*, Session XIII., Chap. I.) =**Syn. 1.** *Present*, *Gift*, *Donation*, *Gratuity*, *Largess*, *Grant*. The difference between *present* and *gift* is felt in the fact that one may be willing to accept as a *present* that which he would not be willing to accept as a *gift:* a *gift* is to help the one receiving it; a *present* does him honor, or expresses friendly feeling toward him. A *present* is therefore ordinarily to an individual; but in law *gift* is used, to the exclusion of *present*, as including all transfers of property without consideration and for the benefit of the donee. A *donation* is of considerable value, and generally made to some public institution: as, a *donation* of books to a public library. *Gratuity* emphasizes the fact that the receiver has no legal claim to the gift; it is a gift to an inferior, as a fee to a servant, and generally a small sum: as, a self-respecting man will not expect a *gratuity* for every little service. *Largess* is an old word, representing a gift from a superior, especially one high in authority, generally shared by a considerable number. A *grant* is rarely the act of a private individual, but rather of a sovereign, legislature, or corporation: as, a *grant* of land to a company.

It differs from nomination in this, that, while *presentation* signifies offering a clerk to the bishop for institution, nomination signifies offering a clerk to the patron in order that he may be presented. *Hook.*

Hence—(*b*) The nomination by one ecclesiastical authority of a candidate to be appointed by another. In the Protestant Episcopal Church the right of presentation to the bishop is lodged in the vestry or other parish authorities. (*c*) The right of presenting a clergyman.

If the bishop . . . admits the patron's *presentation*, the clerk so admitted is next to be instituted by him.

6. In *obstet.*, the appearance of a particular part of the fetus at the superior pelvic strait during labor. The most frequent form is *vertex presentation*, or presentation of the upper and back part of the fetal head. For each presentation there are several positions. See *position*, 10.

7. A cognitive modification of consciousness; an idea; a representation. This use of the word has recently been introduced to translate the German *vorstellung*, the term used by Wolff to translate the Latin *repræsentatio*. None of these words has ever been scientifically defined, and they are used, like their synonym *idea*, with vague variations of meaning. Of these, the following appear to be types: (*a*) An idea in general; any mental object subject to attention and association. Kant divides presentations (*vorstellungen*) in this sense into unconscious presentations and perceptions, the latter into sensations and cognitions, the latter again into intuitions and concepts, and the latter into empirical and pure concepts.

All that variety of mental facts which we speak of as sensations, perceptions, images, intuitions, concepts, notions, have two characteristics in common: (1) they admit of being more or less attended to, and (2) can be reproduced and associated together. It is here proposed to use the term *presentation* to connote such a mental fact, and as the best English equivalent for what Locke meant by idea and what Kant and Herbart called a Vorstellung.
J. Ward, Encyc. Brit., XX. 41.

(*b*) A figurate conception; a product of the imagination.

The term *presentation* [German *vorstellung*], which Hegel employs to name these "picture-thoughts" or "figurate conceptions," corresponds to the facts of their nature. A *presentation* is one of two things: either a particular thing taken under general aspects, or a universal narrowed down to a particular thing. Thus, as it has been seen, a general name expresses a universal relation or attribute, but confines it to a particular object or class.
Wallace, Prolegomena to Hegel's Logic, xii.

(*c*) A direct percept; a presentative cognition.

2. In *mech.*: (*a*) An equilibrated force.

Experience . . . showed that the *pressures* of a vault cannot be concentrated upon any single point, but only upon a line which extends over a considerable portion of the pier from the springing point upwards.
C. H. Moore, Gothic Architecture, p. 81.

(*b*) A force per unit area exerted over the surface of a body or part of a body, and toward the interior of the body. A force exerted upon a surface is necessarily equilibrated; otherwise, since the surface has no mass, it would produce infinite velocity until equilibrium ensued. A pressure can produce no motion, because it is a state of equilibrium; but a continuous variation of pressure in a given direction will tend to produce motion toward the places of less pressure. Thus, if a cylinder of liquid in a tube is under greater pressure per square inch at one end than at the other, there will be a tendency to motion toward the end where the pressure is less. (*c*) Stress in general, being either thrust, pull, or shearing stress. For *axis of pressure*, *conjugate pressure*, and other phrases where *pressure* means *stress*, see the latter word.

Boyle discovered a law about the dependence of the *pressure* of a gas upon its volume, which showed that if you squeeze a gas into a smaller place it will press so much the more as the space has been diminished.

Absolute pressure. See *absolute*.—**Absolute steam pressure**, the total pressure computed from the zero of an absolute vacuum: distinguished from *relative pressure*, or from pressure indicated in pounds, kilograms, or other measure of weight above the ordinary atmospheric pressure at the sea-level. Ordinary steam-gages indicate pressure above that of the atmosphere. To the pressure so indicated the pressure of the atmosphere must be added to obtain the absolute steam pressure.—**Atmospheric pressure.** See *atmosphere*, 2.—**Center of pressure.** (*a*) In *physics*, that point of a body at which the whole amount of pressure may be applied with the same effect it would produce if distributed. (*b*) Specifically, in *hydros.*, that point of a plane, or of the side of a vessel containing a liquid, to which if a force were applied equal to the total pressure and in the opposite direction, it would exactly balance the total pressure.—**High pressure.** (*a*) Formerly, a phrase noting all steam-engines working at pressures materially higher than atmospheric pressure, but now merely a relative term. See *low pressure*. (*b*) Figuratively, a high degree of mental ension.

Miss Squeers . . . was . . . taken with one or two chokes and catchings of breath, indicative of feelings at a *high pressure*. *Dickens*, Nicholas Nickleby, xii.

Intensity of a pressure. See *intensity*.—**Low pressure**, in steam-engines, a phrase noting a motor using steam at a comparatively small pressure. The precise signification of the term is undetermined, but the standard of pressure is steadily rising, so that engines that were formerly considered high-pressure are now looked upon as low-pressure engines. The phrase formerly implied the presence of a condenser and pressure of not more than six pounds above atmospheric pressure, but it now has reference solely to the pressure, and describes that only relatively.—**Pressure myelitis**, myelitis due to compression of the spinal cord, as by a tumor.—**Pressure of atmosphere.** See *atmosphere*, 2.

pressure-figure (presh′ūr-fig″ūr), *n.* In *mineral.*, a figure produced in a section of some minerals by the pressure of a rather sharp point: thus, upon a sheet of mica the pressure-figure has the form of a six-rayed star, which is diagonal in position to the more easily obtained percussion-figure—that is, its rays are normal to edges of the prism and clinopinacoid.

pressure-filter (presh′ūr-fil″tėr), *n.* A filter in which the liquid to be filtered is forced through filtering material by pressure greater than that of its own weight in the filter. Positive increase of the difference between the pressure on the liquid surface and against the discharge outlet is effected either by forcing air into an inclosed space over the liquid, by increasing the head through use of a standpipe, or by decreasing the atmospheric pressure upon the discharge outlet.

pressure-forging (presh′ūr-fōr″jing), *n.* A method of shaping metal in dies in a forging-press by means of great pressure, usually hydraulic; hydraulic forging.

pressure-gage (presh′ūr-gāj), *n.* 1. An apparatus or attachment for indicating the pressure of steam in a boiler.—2. In *gun.*, an instrument used to determine the pressure of powder-gas per square unit of area in the bore or chamber of a gun. The gas acts upon one end of a piston, whose opposite extremity is armed with a pyramidal or circular cutter, as in the Rodman gage; a conical cavity with a continuous spiral thread on its interior surface, as in the Woodbridge pressure-gage; or an anvil-head to compress a copper cylinder, as in the English "crusher" gage. With the two cutter-gages, the lengths of the indentations in the soft copper disks are measured and compared with cuts of the same length made in the testing-machine by the same cutters. From the tests in the machine, a table of lengths of cuts, with the pressures required to produce them, is made up. Hence, measuring the indentation in the disk taken from the pressure-gage, and turning to this table, the pressure exerted by the powder in the bore of the gun will be found opposite the measured length. The disks used in the pressure-gage and in the testing-machine should be taken from the same bar of copper, in order to secure a uniform density. In the "crusher" gage, the diminution in length of the copper cylinder is measured, and the pressure found by the testing-machine to produce an equal reduction in length of a cylinder from the same copper is assumed to be that exerted upon the bore of the gun. Pressure-gages are placed either in a seat in the front of the breech-mechanism or in the base of the cartridge-case or bag.

Pressure-gage.

a, piston; *i*, housing; *b*, screw-plug which closes the housing; *f*, gasket; *g*, recess for engagement of wrench with the plug; *d*, guide for cutting- or indenting-tool *d*″; *c*, register, a disk of copper, the indentation in which after discharge indicates the highest pressure attained in the gun during the combustion of the explosive; *e*, small copper cup or gas-check, which, while it transmits the pressure to the piston, prevents gas from entering the housing; *h*, groove for attaching the cartridge.

pressure-note (presh′ūr-nōt), *n.* In *music*, a note with a short crescendo upon it, as $\overline{\overline{p}}$, indicating a tone which is to be pressed into loudness as soon as sounded.

(*a*) An inference which a jury, or a judge sitting in the place of a jury, may without error draw from a given state of facts, but is not bound to draw from them: called by way of distinction a *presumption of fact*. (*b*) An inference which, in absence of evidence to the contrary, the law draws, and a jury or judge cannot without error refuse to apply: called by way of distinction a *legal presumption* or a *presumption of law*; more specifically, a *rebuttable legal presumption*. (*c*) An inference which the law, usually for reasons of public policy, draws from a given state of facts, and refuses to allow evidence to countervail the inference: called a *conclusive presumption* or an *irrebuttable presumption*. (See *conclusive*.) Thus an infant under 7 is conclusively presumed incapable of criminal intent, and the law will not allow evidence to be received that he was precociously capable of it. An infant between 7 and 14 (by statute now in N. w York 12) is presumptively incapable of such intent, but this, though a presumption of law which cannot be disregarded in the absence of evidence, may be rebutted by evidence of actual capacity. An infant over that age shown to be untaught and dull of comprehension might be inferred to be without such capacity, but this inference (unless the evidence was clear) would be only a presumption of fact, which the jury alone could draw, and the court could not control.—**Philosophical or logical presumption**. 2. One who is ordained to the pastoral or sacerdotal office; a presbyter; an elder. In Wyclif the word *priest* is used where in Tyndale and the authorized version the word *elder* is used; for example, "For this cause left I thee in Crete, that thou shouldest reforme the things that are wanting, and shouldest ordaine *priestes* [presbyters, πρεσβυτέρους; authorized version *elders*] by cities as I also appointed thee" (Titus i. 5).

3. Specifically, in hierarchical churches, the second in rank in the clerical orders, between bishop and deacon. Etymologically, the word *priest* is a derivative or modification of the word *presbyter*. As, however, the office of the presbyterate has been regarded in the Christian church from primitive or early times as a sacerdotal office in so far as it confers power to celebrate the eucharist and to confer absolution, and as no church officer below a presbyter can exercise these functions, and all above a presbyter continue to exercise them in virtue of their ordination as presbyters, the title of *presbyter* and that of *sacerdos* or ἱερεύς (sacrificing priest) soon came to be regarded as synonymous, and either one or the other of these titles to be preferred in popular use in different languages, to the exclusion of its synonym. The title of *priest* (ἱερεύς, *sacerdos*) was in the early church given by preëminence to the bishop (specifically the *high priest*) as ordinary celebrant of the eucharist in cities and the fountain of sacerdotal authority. The Roman Catholic Church teaches that it is the office of a priest "to offer, bless, rule, preach, and baptize." These same offices are assigned to priests in the Orthodox Greek and other Oriental churches and in the Anglican Church. In the church last named the form of ordination gives authority to forgive or retain sins and be a dispenser of the word and sacraments, and only priests (including bishops as in priest's orders) can give benediction, pronounce absolution, and consecrate the eucharist.

According to some authorities, laymen also were admitted among these preachers. The order was suppressed in 1381 or 1382, not long after its foundation. It had, however, succeeded in disseminating Wycliffite teachings widely throughout England. All the italicized words go back by derivation to the idea of being or going before. *Primary* and *prime* mean first in time, and now especially first in order of importance: as, a *primary* class, definition, consideration, planet; *prime* mover, importance, idea (see definition of *prime*). *Primitive* means belonging to the beginning or origin, original, hence old-fashioned, having an old-fashioned simplicity: as, a *primitive* word, the *primitive* church, *primitive* purity, manners, unconventionality, dress. *Pristine* is essentially the same as *primitive*, except that it is never uncomplimentary; it is still more closely synonymous with *original*. *Primeval* means of the first or earliest ages, and nothing else. *Primordial* and *primal* are much the least common of these words; *primal* is poetic for *prime* or *primitive; primordial* pertains to that which is the first, but has or has had a history or development: as, *primordial* rocks; "a *primordial* leaf is that which is immediately developed from the cotyledon; in history or physiology we speak of the *primordial* condition of man, and in metaphysics of the 'primordial facts of an intelligent nature' (Sir W. Hamilton)" (*C. J. Smith*, Synonyms Discriminated, p. 597). See *original*.

Such feathers are commonly the largest or longest and strongest of the remiges, and some of them almost always enter into the formation of the point of the wing. They are collectively distinguished from the succeeding set, situated upon the forearm or cubit and known as *secondaries*. The primaries are enumerated from without inward, or toward the body, the *first* primary being the outermost remex. In most birds they are 10 in number; in many oscine passerine birds there are only 9; a few birds have 11. See cuts under *bird, covert,* and *emarginate*.

S. politics*, a meeting of voters belonging to the same political party in a ward, township, or other election district, held for the purpose of nominating candidates for office, choosing delegates to a convention, etc. Theoretically every voter belonging to the party in a district has a right to attend the primary and vote, but in cities and large places only registered voters who have answered certain test questions relating to party adherence have that privilege. Compare *caucus*.

5. A body in relation to a smaller body or bodies which revolve around it: as a planet in relation to its satellites.—**Direct primary,** a preliminary election in which the voters select nominees for office; in many cases the voters select also the party committees. 2. A bishop of a see ranking as first in a province or provinces; a metropolitan as presiding in his province, or one of several metropolitans as presiding over others. The term *primate* (*πρωτεύων*) has never been in regular use in the Greek Church. The title of *exarch* comes nearest to it. In the Roman Catholic Church a primate is a bishop or an archbishop to whom is delegated a certain jurisdiction as vicar of the Pope over the bishops of his province, or to whose see such authority has formerly been delegated. In the Church of England the Archbishop of Canterbury has the title *Primate* of all England, while the Archbishop of York is *Primate* of England. 2. The first hour or period of the day. Specifically—(*a*) The first hour; the first twelfth of the time between sunrise and sunset. (*b*) In the early church, the Roman Catholic Church, the Greek Church, and in Anglican religious houses, etc., and in private devotion, one of the seven canonical hours; an office said, or originally intended to be said, at the first hour after sunrise. Prime follows next after matins and lauds. The psalms of the Greek office of prime (*ἡ πρώτη,* sc. *ὥρα*) are those already used in the fifth century (Psalms v., xc., ci.); in the Western Church they are Psalms xxii.–xxvi., liv., cxviii., cxix. 1–32 (with varying distribution according to the day and use). Among the principal features of the office are the hymn *Jam lucis orto sidere* (Now that the daylight fills the sky), the Athanasian Creed, Little Chapter, Lord's Prayer, Creed, Preces, Confession, Absolution, and Collects.

He made him to ben delyvered out of Presoun, and commanded that Psalm to ben seyd every day at *Pryme*.

And but little at a time.
Swift, Verses on a Lady.

5. In *fencing:* (*a*) The first of eight parries or guards against thrusts in sword-play, afterward retained in exercise with the foils; the first guard a swordsman surprised by an attack could make, while drawing his weapon from the scabbard near his left thigh. It was followed by parries in *seconde*, *tierce*, *quarte*, up to *octave*, according as thrusts followed at the openings in the defense made by such guards. In prime guard the point remains low, the hand higher than the eyes, as in drawing the sword, and the knuckles are upward. It is the ordinary position of the German student "on guard," when fencing with the schläger. Hence—(*b*) Sometimes, the first and simplest thrust (and parry) which can be made after two fencers have crossed foils and are "on guard" with the left sides of their foils touching: used thus for the direct thrust. This is by some writers called *modern prime*, while the true prime is called *ancient* or *old prime*. In both *old* and *modern prime* the word *prime* is used to indicate the thrust as well as the parry or guard; but this comes from suppression of "in": thus, prime thrust, for thrust in *prime*. *Prime*, *seconde*, etc., represent numbered sections of an ideal chart covering such parts of a swordsman's trunk as are visible to his opponent, each of which sections is supposed to be guarded by the parry thus numbered. Hence the meaning of a "thrust in prime," etc.

6. In *chem.*, a number employed, in conformity with the doctrine of definite proportions, to express the ratios in which bodies enter into combination. Primes duly arranged in a table constitute a scale of chemical equivalents. They also express the ratios of atomic weights.

(*b*) A term used in the playing of this game.—**9.** In *music:* (*a*) A tone on the same degree of the scale or staff with a given tone. (*b*) The interval between any tone and a tone on the same degree with it. (*c*) The simultaneous combination of two tones on the same degree. (*d*) In a scale, the first tone; the tonic or key-note. The typical interval of the prime is the unison, acoustically represented by the ratio 1:1; such a prime is called *perfect* or *major*. A prime in which one tone is a half-step above the other is called *augmented* or *superfluous*. The perfect prime is the most perfect of all consonances—so perfect, indeed, that in its ideal form it is better described as a unison than as a consonance. In harmony, the parallel motion of two voices in perfect primes is forbidden, except when a strictly melodic effect is desired: such primes are called *consecutive*. Compare *consecutive fifth* and *consecutive octave*, under *consecutive*.

10. One of the fractions into which a unit is immediately divided; a minute. It is generally $\frac{1}{60}$, but sometimes $\frac{1}{10}$. Hence, an accent as the symbol of such a fraction: thus *b′*, in algebra, is read "*b* prime."

11. The footsteps of a deer. *Halliwell.*—**High prime†**, probably the close of prime—that is, 9 A. M. See def. 2 (*c*).

A reformed primer was set forth under Henry VIII. in 1545, and continued in use with alterations till 1575. A new series of primers began in 1553, and unauthorized primers were also often issued. Books of devotion closely resembling the old primers in contents and character are extensively used among Anglicans at the present day.

The lunar and solar tides are coincident at spring tide (new or full moon). The lunar day is 24h 52m, and the solar day is 24h long; hence the solar tide occurs more and more in advance of the lunar tide through the 14-day interval between spring tides, at the end of which a second coincidence of the two tides is brought about. At the mid-interval (quadrature or neap tides), lunar high tide falls with solar low tide, and no displacement in the time of tide occurs: but in the first half interval (spring to neap tides) the solar tide causes the actual tide to advance upon the lunar tide (priming of the tides), while in the second half interval (neap to spring tides) the solar tide causes the actual tide to follow after the lunar tide (lagging of the tides). The terms *priming* and *lagging* are used in the sense here given by the U. S. Coast Survey. But the same terms denote sometimes the shortening and the lengthening of the interval between successive lunisolar tides: in this meaning, priming occurs through the week whose middle comes at spring tide (new or full moon), while lagging occurs through the week whose middle falls at neap tides (quadratures).

In *bot.*, noting specific types, in opposition to forms resulting from hybridization. *Henslow.*—6. In *geol.* of the earliest or supposed earliest formation. in the early history of geology noting the older crystalline rocks of which the age and stratigraphical relations were uncertain, and the fossils (where these had once been present) either entirely obliterated or rendered so indistinct by metamorphism of the strata in which they were embedded that their determination was a matter of doubt. Many of the rocks formerly called *primitive* are now known to be more or less thoroughly metamorphosed Paleozoic strata, and in the progress of geological investigation they have been referred to their place in the series of stratified formations. Other so-called *primitive* rocks belong to the azoic or archæan series (as this latter term was and still is used by Dana)—that is, they unmistakably underlie unconformably the oldest known fossiliferous strata. These azoic rocks are made up in part of eruptive masses, and in part of highly metamorphosed sedimentary deposits which, so far as can be determined from existing evidence, were deposited before the appearance of life on the earth. As there is much primitive rock of which the geological age has not as yet been fixed, it has been found convenient to designate this simply as *crystalline* or *metamorphic*; such rocks are, however, often called *archæan;* but this cannot be properly done until their infra-Silurian position has been established by observation.

These remarkable formations [granite, granitic schist, roofing-slate, etc.] have been called *primitive*, from their having been supposed to constitute the most ancient mineral productions of the globe, and from a notion that they originated before the earth was inhabited by living beings, and while yet the planet was in a nascent state. *Sir C. Lyell*, Prin. of Geol. (4th ed., 1835), III. 336.

Thus, the form

$$x^2 - 4xy + 2y^2,$$

by means of the transformation

$$x = \xi - 3\eta$$
$$y = 2\xi - 5\eta$$

(the determinant of which is unity), is shown to be equivalent to

$$\xi^2 - 2\xi\eta - \eta^2,$$

and this latter is evidently primitive.—**Primitive groove**, the first furrow which appears along the midline of the back of a vertebrate embryo, in the site of the future cerebrospinal axis. The primitive groove is regarded as representing the fused lips of a portion of the blastopore (which see), and lies at the posterior end of the embryo, ultimately disappearing without forming any portion of the adult animal. Also called *primitive furrow, streak*, and *trace*.—**Primitive group.** See *group*1.—**Primitive Methodist Connection**, a Wesleyan denomination founded in 1810 by Hugh Bourne. In doctrine it is in substantial accord with other Methodist churches; in polity it is substantially Presbyterian. 2. Descent to the eldest son; the principle or right by which (under the Norman law introduced into England) the oldest son of a family succeeds to the father's real estate in preference to, and to the absolute exclusion of, the younger sons and daughters. The ancient customs of gavelkind and borough-English form exceptions to the general rule of law as to primogeniture. (See *gavelkind* and *borough-English*.) In the modified form of the law of primogeniture now existing in England, the law, if left to operate, carries the land of a person dying to male heirs singly, in succession preferring the eldest, but to female heirs equally in common, and carries personalty to wife and children with no preference for the eldest son.

He was the first-born of the Almighty, and so, by the title of *primogeniture*, heir of all things. *South*, Sermons, IV. x.

The abolition of *primogeniture*, and equal partition of inheritances, removed the feudal and unnatural distinctions which made one member of every family rich and all the rest poor, substituting equal partition, the best of all agrarian laws. *Jefferson*, Autobiog., p. 40.

Primogeniture, as we know it in our law, had rather a political than a civil origin, and comes from the authority of the feudal lord and probably from that of the tribal chief; but here and there on the Continent there are traces of it as a civil institution, and in such cases the succession of the eldest son does not exclude provision for the younger sons by what are called appanages. *Maine*, Early Law and Custom, p. 261.

Representative primogeniture, the rule of feudal inheritance by which the issue of a deceased child were regarded as standing in the place of that child, subject to the same preference of males over females among them, and of elder over younger males among them, as obtained among children inheriting directly: so that, if an elder son died leaving sons and daughters, the eldest of the sons would take what his father, if living, would have taken.

primogenitureship (prī-mō-jen'i-tūr-ship), *n.* [< *primogeniture* + *-ship*.] The state or right of a first-born son.

By the aristocratical law of *primogenitureship* in a family of six children, five are exposed. Aristocracy has never but one child. *Burke*, Appeal to the Old Whigs.

Of all the results of geological and paleontological investigation during the past half-century, there is no one so remarkable as the revelation of the existence of the so-called *primordial* fauna. It is now clearly established that there was a time when life was represented by a few forms, which were essentially the same all over the globe. What has long been known to be true for Europe and America has been recently supplemented, for Asia, by the investigations of Richthofen in China, where the peculiar *primordial* fauna seems to be largely developed, bearing, as Professor Dames remarks, "an astonishing resemblance to that of North America and Scandinavia." *Whitney and Wadsworth*, The Azoic System, p. 546.

Primordial cell, in *bot.*, a cell of the simplest character, one which does not possess a cell-wall.—**Primordial utricle**, in *bot.*, the layer of somewhat denser protoplasm which lines the inner surface of the wall of a vacuolated cell.—**Primordial zone**, the name given by Barrande to certain strata in Bohemia which there contain the lowest fauna, regarded by him as the equivalent of the Taconic fauna of New York, and of the Cambrian of North Wales. In these various regions, as well as in other parts of the globe, as in Canada, China, and the Cordilleras, the fauna of the primordial zone is strikingly similar, consisting largely of trilobites and brachiopods, certain genera of which appear to have had a world-wide distribution. = Syn. 1. *Prime*, etc. See *primary*.

Cf. *primerole*, *primrose*.] **1.** A genus of sympetalous plants, the primroses, type of the family *Primulaceæ* and the tribe *Primuleæ*, characterized by a conspicuous salver-shaped corolla, with five opposite stamens borne on its long tube, and by a roundish five-valved and one-celled capsule, containing many peltate seeds. There are about 150 species, mainly mountain-dwellers of Europe and

Flowering plant of *Primula prænitens*.

Asia, with about 15 in North America, 1 in extreme South America, and 1 in the mountains of Java. They are beautiful low-growing plants, with perennial rootstocks. The leaves are all radical, obovate or roundish, entire or toothed, and form a spreading tuft. The flowers are dimorphous, some having a short style and stamens borne high up on the tube, others opposite in both respects. They are white, pink, purple, or yellow in color, grouped in bracted umbels—in the true primrose, however, appearing as if on separate stalks. The common primrose of Europe and northern Asia, elsewhere in gardens, with yellow or straw-colored flowers in early spring, consists of three species, often regarded as varieties, corresponding to the names *primrose* (*P. acaulis*), *cowslip* or *pagle* (*P. veris*), and *oxlip* (*P. elatior*). It is generally believed that *P. elatior* is a good species, indigenous, though rare, in England, where it is called *Bardfield oxlip;* but, according to Darwin, *P. acaulis* and *P. veris* are distinct, while the common oxlip is a hybrid between them. (See the above common names, and *herb-peter* (*St.-Peter's-wort*), *lady-key*, *petty mullen* (under *mullen*), and *palsywort*.) Numerous other species are beautiful and more or less cultivated. See *auricula*, 1, *baziers*, *bear's-ear*, *dusty-miller*, *French cowslip* (under *cowslip*), *polyanthus*, and *primrose*.

2. [*l. c.*] Any plant of the genus *Primula*.

Primulaceæ (prim-ū-lā′sē-ē), *n. pl.* [NL. (Ventenat, 1799), < *Primula* + *-aceæ*.] A very distinct family of dicotyledonous sympetalous herbs of the order *Primulales*, characterized by its five stamens opposite to the five lobes of the regular corolla, and the capsular ovary containing two or more ovules, a single style, and an undivided stigma; the primrose family. It includes about 350 species, classed under 5 tribes and 28 genera, natives of temperate regions and mainly alpine, rare in the southern hemisphere. They are herbs, growing usually from a perennial rootstock; the few that occur in the tropics become there annuals, an inversion of the usual effect of the tropics. They bear undivided or rarely lobed leaves, either all radical, or alternate, opposite, or whorled; and commonly racemed, umbeled, or long-stalked flowers. Very many of the most-prized flowers of cultivation belong to this family, as the primrose, cowslip, polyanthus, auricula, cyclamen, and soldanelle. For the best-known genera see *Primula* (the type), *Lysimachia*, *Cyclamen*, *Trientalis*, *Glaux*, *Coris*, *Samolus*, *Soldanella*, *Dodecatheon*, and *Hottonia*.

Primulales (prim-ū-lā′lēz), *n. pl.* [NL. (Lindley, 1833), < *Primula*, q. v.] An order of dicotyledonous sympetalous plants, characterized by a regular five-lobed corolla, the stamens, when of the same number, opposite the lobes. It contains the families *Primulaceæ*, *Myrsinaceæ*, *Plumbaginaceæ*, and *Theophrastaceæ*. See these terms, also the type genera, *Primula*, *Myrsine*, *Plumbago*, 2, and *Theophrasta*.

★**primulin** (prim′ū-lin), *n.* [< NL. *Primula* + *-in*[2].] A crystallizable substance obtained from the root of the cowslip.

primum frigidum (prī′mum frij′i-dum). [L.: *primum*, neut. of *primus*, first; *frigidum*, neut. of *frigidus*, cold: see *prime* and *frigid*.] Pure cold: an elementary substance, according to the doctrine of Parmenides.

The first means of producing cold is that which nature presenteth us withal: namely, the expiring of cold out of the inward parts of the earth in winter, when the sun hath no power to overcome it, the earth being (as hath been noted by some) *primum frigidum*.
Bacon, Nat. Hist., § 69.

The dispute which is the *primum frigidum* is very well known among naturalists; some contending for the earth, others for water, others for the air, and some of the moderns for nitre, but all seeming to agree that there is some body or other that is of its own nature supremely cold, and by participation of which all other bodies obtain that quality. But, for my part, I think that before men had so hotly disputed which is the *primum frigidum* they would have done well to inquire whether there be any such thing or no. *Boyle*, Experimental History of Cold, title xvii.

primum mobile (prī′mum mob′i-lē). [L.: *primum*, neut. of *primus*, first; *mobile*, neut. of *mobilis*, movable: see *prime* and *mobile*[1].] In the Ptolemaic system of astronomy, the tenth or outermost of the revolving spheres of the universe, which was supposed to revolve from east to west in twenty-four hours, and to carry the others along with it in its motion; hence, any great or first source of motion.

The motions of the greatest persons in a government ought to be as the motions of the planets under *primum mobile*, . . . carried swiftly by the highest motion, and softly in their own motion.
Bacon, Seditions and Troubles.

A star does not move more obediently from east to west than Bacon obeys, and appropriates as his own, the motion of his *primum mobile*, the King.
E. A. Abbott, Bacon, p. 249.

2. The title of the ruler of a principality: as, the *Prince* of Waldeck; the former *Princes* of Orange. Few such principalities now exist in Europe; they are either small in extent (as Montenegro and Monaco), or in certain relations subordinate in name or reality to a suzerain (as Bulgaria), or to a central government (as Lippe, Waldeck, and the other principalities of the German empire).

3. A title of nobility in certain countries on the continent, superior to *duke:* as, *Prince* Bismarck; *Prince* of Condé. There are, however, many exceptions in the relative standing of particular titles, owing to the fact that many princely designations are little more than courtesy titles, or to the circumstance that some princely titles are historically and intrinsically of comparatively small importance, while some ducal titles, on the contrary, are of the highest, sometimes even of sovereign dignity. *Prince* is the translation of the chief Russian title of nobility (*knyaz*).

4. A courtesy title given to non-regnant members of royal families, and often confined to the younger sons of the sovereign: as, *Prince* Arthur (of Great Britain); *Prince* Henry (of Prussia); the eldest sons are usually called *prince* with a territorial title (as *Prince* of Wales, in Great Britain; *Prince* of Naples, in Italy), *crown prince* (Greece), *prince imperial* (Austria, Germany, etc.), *prince royal* (Denmark, Sweden, etc.), or *duke* with a territorial title (as *Duke* of Sparta, in Greece; *Duke* of Brabant, in Belgium).

The *Prince of the Captivity* was a secular ruler, and pretended to be a descendant of the royal house of David; the Patriarch of the West was an ecclesiastical ruler, of the sacerdotal tribe of Levi. Prince* has a narrow and a broad meaning. It may indicate a son of the *sovereign,* or the grade of prescriptive rank next to that of the *sovereign,* or it may be a general word for *king,* etc., as often in Shakspere. A country not large enough to be ruled by a *king* may be ruled by a *prince,* as some of the states of Germany, and Montenegro. *Sovereign* is an impressive but somewhat general term, being applicable to a *king* or an *emperor,* and expressing a high degree of power and dignity. *Monarch* expresses the fact of ruling alone, and therefore is generally, though not necessarily, applied to one ruling autocratically and with splendid state, with similar figurative use. *Emperor* is sometimes affected, as a grander word than *king,* and seems to express more of absolute rule, but there have been kings of all degrees of absolutism and grandeur. Historically, *emperor* is especially associated with military command.

What deep joy fills the mind of the philosopher when, throughout apparently inextricable confusion, he can trace some great *Principle* that governs all events, and that they all show forth. *Channing*, Perfect Life, p. 109.

Without entering on the various meanings of the term *Principle*, which Aristotle defines, in general, that from whence anything exists, is produced, or is known, it is sufficient to say that it is always used for that on which something else depends; and thus both for an original law and for an original element. In the former case it is a regulative, in the latter a constitutive, *principle*.
Sir W. Hamilton, Reid, Note A, § 5, Supplementary [Dissertations.

It is only by a very careful observation . . . that we are able from the singular and concrete operations to enunciate precisely the general law which is the expression of the regulative *principle*. *McCosh*, Locke's Theory, p. 5.

4. Many traces of this ancient theory [regarding the English common law as existing somewhere in the form of a symmetrical body of express rules, adjusted to definite *principles*] remain in the language of our judgments and forensic arguments, and among them we may perhaps

place the singular use of the word *principle* in the sense of a legal proposition elicited from the precedents by comparison and induction.

The man of *principle* — that is, the man who, without any flourish of trumpets, titles of lordship, or train of guards, without any notice of his action abroad, expecting none, takes in solitude the right step uniformly, on his private choice, and disdaining consequences — does not yield, in my imagination, to any man.

Emerson, War.

7. In *patent law*, a law of nature, or a general property of matter, a rule of abstract science. *George Ticknor Curtis.* A principle is not patentable, although a process for utilizing a principle may be. Compare *process*.

It is very difficult to distinguish it [the specification of the hot-blast furnace for throwing hot air into a furnace instead of coal, thereby increasing the intensity of the heat] from the specification of a patent for a *principle*, and this at first created in the minds of the court much difficulty; but, after full consideration, we think that the plaintiff does not merely claim a *principle*, but a machine embodying a *principle*, and a very valuable one. We think the case must be considered as if, the *principle* being well known, the plaintiff had first invented a mode of applying it by a mechanical apparatus to furnaces, and his invention then consists in this — by interposing a receptacle for heated air between the blowing apparatus and the furnace. *Baron Parke*, 8 Meeson & W., 306.

A principle of human nature, a law of action in human beings; a constitutional propensity common to the human species. — **Archimedean principle.** See *Archimedean*. — **Bitter principles, commutative principle, constitutive principles.** See the adjectives. — **Carnot's principle**, a highly important principle of the theory of heat — namely, that the work done by an engine is proportional to the amount of heat used multiplied into the fall of temperature of that heat in the action of the engine. In the mechanical theory of heat, this principle is transformed into the second law of thermodynamics. It was discovered in 1824 by Sadi Carnot (1796–1832), son of the great war-minister Carnot. — **D'Alembert's principle**, an important principle of mechanics, to the effect that the forces impressed upon a mechanical system may be resolved into forces balancing one another perpendicular to the motions of the particles and of forces whose direct effects would be to make the particles move as they do move. — **Declination of principles.** See *declination*. — **Dirichlet's (or Dirichletian) principle**, a certain important proposition concerning the equation

$$\frac{\partial^2 P}{\partial x^2} + \frac{\partial^2 P}{\partial y^2} = 0.$$

Distributive principle. See *distributive*. — **Doppler's principle**, in *acoustics*, the phenomenon that, when a sound-body is rapidly approaching the ear, the pitch of the sound is raised, because more sound-waves reach the ear per second, and conversely if the sounding body recedes. This principle is also applied in optics, and the rapidity of relative approach or recession of the earth and some of the fixed stars has been deduced from it, by the change in the character of the light (as to wave-length), as shown by the spectroscope. — **Extractive principle.** Same as *extract*, 4. — **First principle**, one of the most general principles, not deducible from others. — **Fruitful principle.** See *fruitful*. — **General principle.** See *general*. — **Helmholtz's principle**, the proposition (enunciated by Helmholtz, a German physicist, born 1821) that if any source of light or of sound situated at any point will by the intervention of any system of reflectors or lenses produce any given intensity of illumination or of sound at any second point, then the same source being placed at the second point would produce the same intensity of radiation at the first point. — **Heterogeneous principle, heteronymous principles, immanent principle.** See the adjectives. — **Huygens's principle**, the proposition (enunciated by Christian Huygens in 1678) that any disturbance due to waves in any part of a medium at any instant is that due to the superposition of all the disturbances reaching it at that instant from the neighboring parts of the medium. — **Hypostatic principle**, a chemical element. — **Material principle.** See *material*. — **Organic principles.** Same as *proximate principles* (which see, under *proximate*). — **Principle of areas**, in *dynam.*, the proposition that, if all the external forces acting upon a moving system are directed toward an axis, the rotation-area for that axis will be described with a uniform motion. — **Principle of causality.** See *law of causation*, under *causation*. — **Principle of certainty, of coincidence.** See *certainty, coincidence*. — **Principle of conservation of number**, in *geom.*, the proposition that, if there is a finite number of figures of a given general description subject to certain conditions, then this number remains, if finite, of the same value, however the general description be specialized. For example, if we wish to know how many lines can cut four given lines, we take four special lines, say two cutting one another and two others cutting one another. Then there are evidently just two lines — namely the one through the two points of intersection and the one common to the planes of the two pairs — which cut all the four lines; and consequently the same will be true in all cases where the number remains finite. — **Principle of contradiction.** See *contradiction*. — **Principle of correspondence**, in *geom.*, the principle that, if the points on a line have an m to n correspondence with one another, there are $m + n$ points which correspond to themselves. There is also an extension to the plane. — **Principle of duality, of homogeneity, of identity.** See *duality*, etc. — **Principle of least action, of least constraint.** See *action, constraint*. — **Principle of similitude**, in *dynam.*, proposition 32 of section 7 of the Second Book of Newton's "Principia," namely that, if two systems are geometrically similar, and have their corresponding masses proportional, and begin to move in the same way, in proportional times, they will continue to move in the same way, provided the forces are proportional to the masses and the linear dimensions, and are inversely as the squares of the times. — **Principle of sufficient reason.** See *reason*. — **Principle of the arithmetical mean**, the proposition that the mean of different results of direct observation of a quantity is the best way of combining them. — **Principle of the composition of rotations.** See *rotation*. — **Principle of the inclined plane**, in *mech.*, same as *principle of the parallelogram of forces* (which see, under *force*[1]). — **Principle of the last multiplier**, a certain principle used in the solution of dynamical equations. — **Principle of the lever**, in *mech.*, same as *Archimedean principle* (*a*) (which see, under *Archimedean*). — **Principle of the parallelogram of forces.** See *force*[1]. — **Principle of translation**, in *math.*, the theorem that all the invariantive properties of a ternary form can be represented by the vanishing of invariants and the identical vanishing of covariants, contravariants, or mixed forms. — **Principle of virtual velocities.** See *velocity*. — **Reductive, regulative**, etc., **principle.** See the adjectives. — **Short-haul principle**, the principle that the charge for carrying freight should not be higher for a shorter than for a longer distance. See *long haul*, under *long*[1]. — **The currency principle.** See *currency*. — **The principle of excluded middle or third.** See *middle*. — **Transcendental principle.** See *transcendental*. = **Syn. 5.** *Principle, Rule, Precept.* "There are no two words in the English language used so confusedly one for the other as the words *rule* and *principle*. . . . You can make a *rule;* you cannot make a *principle;* you can lay down a *rule;* you cannot, properly speaking, lay down a *principle*. It is laid down for you. You can establish a *rule;* you cannot, properly speaking, establish a *principle*. You can only declare it. *Rules* are within your power, *principles* are not. Yet the mass of mankind use the words as if they had exactly similar meanings, and choose one or the other as may best suit the rhythm of the sentence." (*Helps.*) A *principle* lies back of both *rules* and *precepts;* it is a general truth, needing interpretation and application to particular cases. From a *principle* we may deduce *rules* that we lay imperatively upon ourselves or upon others who are under our authority, and *precepts* that we lay upon those who look to us for instruction. It is a *principle* that "the Sabbath was made for man"; details as to the observance of the Sabbath would be not *principles*, but *rules*, maxims, or *precepts*. See *aphorism*.

Christianity is a spirit, not a law; it is a set of *principles*, not a set of *rules*. . . . Christianity consists of *principles*, but the application of those *principles* is left to every man's individual conscience.

F. W. Robertson, Sermons, Marriage and Celibacy.

Nations pay little regard to *rules* and maxims calculated in their very nature to run counter to the necessities of society. *A. Hamilton*, The Federalist, No. 25.

★**printing** (prin′ting), *n.* [Verbal n. of *print*, *v.*] 1. In general, the art or process of making copies or superficial transfers by impression; the reproduction of designs, characters, etc., on an impressible surface by means of an ink or a pig-

ment (generally oily) applied to the solid surface on which they are engraved or otherwise formed. This sense is used specifically in typography of the actual taking of impressions by the operation of a press; in other uses, it is generally accompanied by some descriptive term; and in typography itself different methods are discriminated, as type, letterpress, or stereotype printing, color-printing, etc. Type or stereotype printing is done from a surface in high relief; lithographic printing, from the surface of a flat stone; copperplate printing, from inked lines engraved below the surface of a flat plate of copper or steel. The art of printing with ink from blocks of wood was practised in China at an early undetermined date. Silk and linen fabrics were printed from engraved hand-stamps in Europe in the twelfth century; playing-cards and prints of images were impressed on paper in the beginning of the fourteenth century. Calico-printing, oilcloth-printing, and carpet-printing are also distinct arts, each requiring specially made inks and machinery. Printing for the blind, in letters embossed in relief, is the only form of printing done without ink.

2. The art or process of producing printed matter for reading (including illustrations, etc.) by composition and imposition of types, and their subjection when inked to pressure upon paper in a printing-press; the typographic art; typography in the fullest sense. Although documents of a much earlier date exist, which show strong evidence of having been printed in some manner analogous to the modern practice, the history of printing properly begins with the first use of movable molded types, and is accredited to Gutenberg, with the aid of Schoeffer and Fust, of Mainz in Germany, in which city appeared the first book with an authenticated (written) date, 1456. Gutenberg's invention, however, is disputed in favor of his contemporary Coster, of Haarlem in Holland, from whom the former is said to have derived the process. Improvements have since been made in the speed of type-making and in the methods of type-setting, but there has been no radical change in their theory or process. The simple screw hand-press first used for printing from types received no considerable improvement before 1800. Since that date many inventions have been made in printing-machinery, and the collateral arts of stereotyping and electrotyping have been developed. Machines that print from 5,000 to 50,000 copies an hour are to be found in many large cities. The earliest Italian copperplate-print is by Maso Finiguerra, a goldsmith of Florence (1452). Lithography was invented by Aloys Senefelder, of Munich, about 1796; he made prints in 1798, and received a patent in 1800. Typography, also known as letterpress printing, obtains its greatest advantage from the mobility of its types of metal, which can be repeatedly used in endless combinations. Type-printing machinery permits the use, along with types, of engravings on wood, or of stereotype or electrotype plates. In all other kinds of printing, the use of an engraved design in a new combination is not practicable; it can be used only in its first state. Printing comprises two distinct trades — composition, or the art of arranging types, and presswork, or the art of getting impressions from composed types. See *compositor*, *pressman*[1], and *printer*, 2.

3. In *photog.*, the act or art of obtaining a positive photographic picture from a negative, or a picture in which the lights and shades are true to nature from one in which they are reversed. When based upon the properties of a salt of silver, such printing is called *silver-printing*, and similarly with other salts.—4. In *ceram.*, the art of decorating pottery by means of transfers, either by paper printed with mineral colors or by sheets of gelatin printed in oil. By the first plan, the paper is pressed, printed side down, on the ware to make the transfer, and afterward removed by softening in water. By the other plan, the gelatin film or bat simply transfers the oil to the ware, when it can be removed and used again, the oil-print being then dusted with mineral colors.

5. Advertising-bills, posters, dodgers, window-bills, and the like. [Theat. slang.] — **Anastatic printing.** See *anastatic.* — **Artificial or artistic printing.** See *artificial.* — **Bureau of Engraving and Printing.** See *bureau.* — **Chromatic printing.** See *chromatic.* — **Lithographic printing.** See *lithography.* — **Logographic printing,** printing with types bearing whole words or syllables. printing-machine (prin′ting-ma-shēn″), *n.* An apparatus for printing from types or typographic forms, more rapidly than can be done upon the hand press. Made in many forms to print sheets from 3 by 5 to 44 by 64 inches. See *printing-press*. Platen-machines are provided with flat beds for the types, which are impressed by flat platens. Favorite styles of platen-machines for book-work are the Adams press of America and the Albion press of England; for job-work, the Gordon press of America and the Cropper press of England. Cylinder-machines are provided with flat sliding bed-plates for the type-forms, which at intervals are impressed by a rotating cylinder. (See *cylinder-press.*) Rotary machines are provided with cylinders on the curved surface of which the types or plates are fixed, and which are impressed by another rotating cylinder. Most forms of platen- and cylinder-machines receive, by hand-feeding, cut sheets of paper which are delivered printed usually on one side only, and not folded. Some forms of cylinder-machines are provided with two cylinders for printing a sheet on both sides or in two colors. Web-machines (so called because they use paper in a web-roll, which may be two or more miles long) are provided with cylinders on the curved surface of which the plates are fastened, and which are impressed by other cylinders on both sides. All of these machines are complex and have an apparatus for cutting and folding sheets and pasting in supplementary single or double leaves, and are largely used for printing daily newspapers. Their performance varies, according to the size of the sheet and other conditions, from 5,000 to 70,000 copies an hour. Nicholson of England received a patent for a cylinder printing-machine in 1790, but his invention was never perfected. Koenig and Bauer in 1811 did the first practical work on their machine, which in 1814 was used to print the London "Times." Early forms of cylinder-machines have been largely improved by Napier of London and Hoe of New York. The web-machine was introduced in 1853, and has received many improvements from Applegath of London, Marinoni of Paris, Hoe of New York, and others. — **Cradle printing-machine.** See *cradle*.

printing-paper (prin′ting-pā″pėr), *n.* See *paper*.

printing-press (prin′ting-pres), *n.* A machine for taking impressions from an inked surface upon paper. A press that prints from stone is always specified as a lithographic press; a press that prints from etched or engraved copperplates, as a copperplate-press. Presses for typographic printing are broadly divided into three classes — hand-presses, job-presses, and power-presses. Those of the last class are treated under *printing-machine*. The early hand-press was largely of wood. A stone was provided as a bed for the form of types, and iron for minor pieces only. Impression was made by the direct action of a screw on the platen or pressing surface, which covered only one half of the bed-plate of stone. The first adopted improvement was that of Stanhope of England, who in 1798 made a hand-press entirely of iron, with a platen that fully covered the bed-plate. Many improvements have followed. The hand-presses now preferred are those in which impression is given by compound levers, and the descent and return of the platen are controlled by coiled springs instead of the screw. Presses of various forms have been devised for special kinds of printing, as in different colors at the same time. The prevalent style of job-presses, for the printing of cards and small sheets, has the type secured to a bed-plate which stands vertically, and the platen swings to and from it on a rocking shaft, or is brought to it by means of a side-lever. They are often worked by a treadle, and hence are also called *treadle-presses*. Their prototype is the Gordon press, invented by George P. Gordon in 1850. — **Chromatic printing-press.** See *chromatic.* — **Copperplate printing-press,** a roller-press used in printing from plates engraved or etched in sunken lines. The original form, still in use, was invented in 1545. It consists of a bed moving on rollers and supporting the plate which is to be printed from. The requisite pressure is obtained by means of a roller above the bed, having a vertical adjustment by means of screws attached to its journal-boxes. The bed is rolled forward to bring the plate and the sheet upon which the drawing is to be transferred beneath the pressing-roll. The pressure is adjusted by means of the screws, and the roll turned by a lever-arm attached to its axis, causing the plate and its bed to roll forward beneath it, so as to subject the whole surface of the plate and the sheet which covers it to its action. — **Multicolor printing-press,** a chromatic printing-press for printing simultaneously in bands or stripes of different colors: distinguished from a *chromolithographic press*, which prints in overlaid colors by successive operations.

Pg. *prior* = It. *priore*, < ML. *prior*, a prior, lit. superior, < L. *prior*, former, superior: see *prior*, *a.*] A superior officer; a superior. Specifically—(*a*) *Eccles.*, an official in the monastic orders next in dignity and rank to an abbot. Before the thirteenth century he seems to have been called *provost* (præpositus) or *prelate* (prælatus), and *prior* seems to have meant any superior or senior. If in an abbey, and an assistant of the abbot, he is called a *claustral prior;* if the superior of a priory—that is, of a monastery of lower than abbatial rank—he is called a *conventical* or *conventual prior.* The superiors of the houses of regular canons were always called *priors*, and the commandants of the priories of the military orders of St. John of Jerusalem, of Malta, and of the Templars were called *grand priors.* See *hegumen.*

Priority* is the state or fact of coming first in order of time; what little use it has beyond this meaning is only a figurative extension. *Antecedence* is strictly *priority,* without any proper figurative use. *Precedence* may mean *priority,* but generally means the right to go or come first, the privilege of going before another: as, the question of *precedence* among sovereigns or ambassadors makes great trouble, because the dignity of the nations represented is supposed to be at stake. *Preëminence* is, figuratively, height by nature above all others, generally in some one respect: as, the *preëminence* of Shakspere as a dramatist. *Predominance* is superior and dominating power or influence: as, the *predominance* of a certain faction; figuratively, the *predominance* of light or shade or a particular color in a certain picture. *Preference* is the putting forward of a person or thing by choice, on the ground of worthiness, or on account of the taste, fancy, or arbitrary will of the one preferring: as, to give the *preference* to Milton over Dante. *Superiority* may refer to nature or to given or achieved position over others; it differs from *supremacy* as the comparative differs from the superlative degree: as, the *superiority* of the appearance of certain troops; the *superiority* of the dairy-products of a certain region; *superiority* to one's circumstances; *supremacy* on the land and *supremacy* on the sea do not always go together. See *previous.*

prism (prizm), *n.* [= F. *prisme* = Sp. Pg. It. ★*prisma* = D. G. Sw. Dan. *prisma,* < LL. *prisma,* a prism (in geom.), < Gr. *πρίσμα,* a prism (in geom.), lit. something sawed (as a block of wood), also sawdust, < *πρίειν, πρίζειν,* saw.] **1.** In *geom.,* a solid whose bases or ends are any similar, equivalent, and parallel plane polygons, and whose sides are parallelograms. Specifically—**2.** An optical instrument consisting of a transparent medium so arranged that the surfaces which receive and transmit light form an angle with each other: usually of a triangular form with well-polished sides, which meet in three parallel lines, and made of glass, rock-salt, or quartz, or a liquid, as carbon disulphid, contained in a prismatic receptacle formed of plates of glass. A ray of light falling upon one of the sides of a prism is refracted (see *refraction*) or bent from its original direction at an angle depending upon its own wave-length, the angle of incidence, the angle of the prism, and the material of which the prism is made. This angle of deviation, as it is called, has a definite minimum (minimum deviation) value when the angle of incidence is equal to the angle of emergence. The angle of deviation increases as the wave-length of the light-ray diminishes; consequently, if a pencil of white light falls upon the prism, the different rays are separated or dispersed, and a spectrum is the result. (See *spectrum.*) Prisms are hence used in spectrum analysis to decompose light, so that the rays of which it is made up may be examined.

Glass Prism upon Adjustable Stand.

Make *prisms* in every carven glass.
Tennyson, Day-Dream, The Sleeping Palace.

3. In *crystal.,* a form consisting of planes, usually four, six, eight, or twelve, which are parallel to the vertical axis. If the planes intersect the lateral axes at the assumed unit distances for the given species, it is called a *unit prism;* otherwise it may be described, according to the position of the planes, as a *macroprism, brachyprism, orthoprism,* or *clinoprism.* In the triclinic system the form includes two planes only, and it is hence called a *hemiprism.* In the tetragonal system the unit prism is sometimes called a *protoprism,* or prism of the first order, and the diametral prism, whose planes are parallel to a lateral axis, a *deuteroprism,* or prism of the second order; these names are also used in an analogous manner in the hexagonal system.

4. It consists of a combination of two prisms, made of two different transparent substances of unequal dispersive powers, as flint-glass and crown-glass.—**Amici's prism,** in *microscopy,* a form of illuminator consisting of a prism having one plane and two lenticular surfaces, so that it serves at once to concentrate the rays and to reflect them obliquely upon the object. It is supported upon an adjustable stand.—**Bisulphid prism.** See *bisulphid.*—**Diametral prism.** See *diametral planes,* under *diametral.*—**Diatom prism,** a prism used as an attachment to a microscope to give the oblique illumination favorable for observing very fine lines or markings, as those on the shells of diatoms.—**Double-image prism,** in *optics,* a prism of Iceland spar which yields two images of like intensity, but polarized in planes at right angles to each other.—**Equilateral prism,** a prism having equal sides, used as an attachment to a microscope to illuminate the object. It acts on the principle of total reflection.—**Erecting prism,** a prism placed between the two lenses of the eyepiece, and serving to erect the inverted image of a compound microscope.—**Natchet's prism.** (*a*) In *microscopy,* an erecting prism. (*b*) A form of illuminator consisting of a prism with two convex surfaces, by which the light is brought to a focus upon the object.—**Nicol prism,** or *nicol,* a prism of Iceland spar (calcite), used when polarized light is required: named from its inventor, William Nicol, of Edinburgh, who first described it in 1828. The common form is constructed from an oblong cleavage piece, first by grinding two new faces at the ends (as *pp'*) inclined about 68° to the vertical edges, and then cementing the halves together by Canada balsam in the line *AB.* The ordinary ray now suffers total reflection at *c,* and is absorbed by the blackened sides at *g,* while the extraordinary ray, polarized with vibrations parallel to the shorter diagonal of the cross-section, emerges at *e.* Modified forms of the prism, accomplishing the same end, have been devised in recent years (often called *nicols* also), which are much shorter, and hence have the advantages of giving a larger field in the microscope and less loss of light by absorption, together with an important saving of the material; one of these is the Razumovsky prism.—**Prism battery,** a Leclanché battery in which a pair of compressed prisms, containing all the materials commonly used in the porous cup, is employed in place of the latter.—**Reversing prism,** a small obtuse-angled isosceles prism (*p* in the cut) of flint-glass, placed between the eye-lens of a positive eyepiece *e* and the eye, with its longest side parallel to the optical axis of the eyepiece. It inverts the image viewed through the eyepiece, and when it is made to rotate around the optical axis the image also appears to turn, so that any line in it can be made vertical or horizontal at pleasure. This enables the observer to avoid, or to eliminate, certain errors of measurement which depend upon the apparent position of the object.—**Right-angle prism,** a prism attached to a microscope-stand to throw light upon an object. It is so made that it can rotate on a horizontal or vertical axis, so as to throw light as required.—**Wenham prism,** in a binocular microscope, a quadrilateral prism used to refract part of the light-rays from the object up the second tube to its eyepiece.

Vertical and Transverse Sections of a Nicol Prism.

See *powder*.

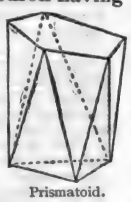
Prismatic Compass.



a, floating card beginning at the N. point and numbered entirely around the circle, 360°; *b*, vertical sight-vane with central vertical wire *d*; *c*, prism. 6†. *pl.* The private parts. *Abp. Abbot.*—**7.** In *law*: (*a*) That relation between different interests of several persons in the same lands which arises under feudal tenures. All the various estates, less than a fee simple absolute, were regarded as so many parts of entire title, and the persons among whom such partial interests were distributed were said to stand in privity or in privity of estate to each other. If the interests belonging to one of such persons devolved either by act of law, as in the case of his death intestate, or by act of the parties, as in the case of a conveyance, upon a third person, that person was thereby brought into privity with him and the others. In the former case he was said to be *privy in law*, in the latter case *privy in deed*, each of these being only species of *privies in estate*. Upon the same principle, whenever several lesser estates were carved out of a larger, as by grant of a qualified interest or life estate leaving a remainder or reversion in the grantor, the parties were termed *privies*. (*c*) In the law of obligations, the mutual relationships between contractor and contractee, and either of them and a third person claiming under the contract, which result from the existence of the contract. Thus, if A gives his note to B, and B separately gives his note to C, there is privity of contract between A and B, and also between B and C, but none between A and C. But if A gives his note to B, and B indorses it over to C, there is privity of contract among all. (*d*) In the law of contracts and torts, the legal relation consequent on joint or common knowledge and concurrence, particularly in respect to a breach of contract, a tort, or a wrong.—**Privity of tenure**, the relation subsisting between a lord and his immediate tenant.

direction. The lee side is flat and in a straight line from stem to stern, and acts as a lee-board or center-board; but the weather side is rounded as in other vessels. This shape, with their small breadth, would render them very liable to heel over, were it not for the outrigger, which is used on either side or on both. The proa is fastened together with coir yarns, is extremely light, and carries an enormous triangular sail. Also called *flying proa*.

They [the Dutch] have *Proes* of a particular neatness and curiosity. We call them Half-moon *Proes*, for they turn up so much at each end from the water that they much resemble a Half-moon with the Horns upwards.

Cath. theol.*, the doctrine that it is lawful to act in a certain manner only when there is a more probable opinion in favor of such action than against it, so that when there are two equally probable opinions, one for and the other against liberty of action, it is not lawful to accept the former opinion and follow one's inclinations. See *probabilism*, *probabilist*.

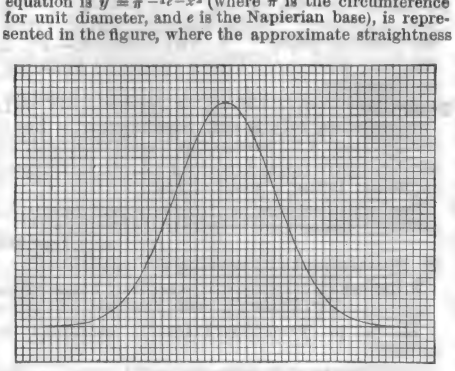
Cath. theol.*, the doctrine that when there are two probable opinions, each resting on apparent reason, one in favor of and the other opposed to one's inclinations, it is lawful to follow the probable opinion which favors one's inclination. See *probabiliorism*, *probabilist*.

The working of the principle known as *Probabilism*. The meaning of this principle . . . is simply this: when a doubt arises as to the binding force of some divine or human precept in any given case, it is permissible to abandon the opinion in favour of obedience to the law—technically known as "safe" (tuta) opinion—for that which favours non-compliance, provided this laxer opinion be "probable." And by "probable" is meant any judgment or opinion based on some reasonable grounds, though with some doubt that the opposite view is perhaps the true one (Gury, Theol. Mor., I. n. 51).
Encyc. Brit., XIV. 636.



probabilist (prob'a-bil-ist), *n.* [= F. *probabiliste* = Sp. Pg. It. *probabilista* = G. *probabilist*, < NL. *probabilista*, < L. *probabilis*, probable: see *probable*.] 1. One who holds the doctrine of probabilism.—2. One who maintains that certainty is impossible, and that probability alone is to govern faith and practice.

probability (prob-a-bil'i-ti), *n.*; pl. *probabilities* (-tiz). [= F. *probabilité* = Sp. *probabilidad* = Pg. *probabilidade* = It. *probabilità*, < L. *probabilita(t-)s*, probability, credibility, < *probabilis*, probable, credible: see *probable*.] 1. The state or character of being probable; likelihood; appearance of truth; that state of a case or question of fact which results from superior evidence or preponderation of argument on one side, inclining the mind to receive that as the truth, but leaving some room for doubt.

Thus, first traditions were a proof alone,
Could we be certain such they were, so known;
But, since some flaws in long descent may be,
They make not truth, but *probability*.
Dryden, Religio Laici, l. 345.

Probability is nothing but the appearance of such an agreement or disagreement, by the intervention of proofs whose connection is not constant, . . . but is or appears for the most part to be so. . . . In which case the foundation of his assent is the *probability* of the thing, the proof being such as for the most part carries truth with it. . . . So that that which causes his assent to this proposition is the wonted veracity of the speaker in other cases.
Locke, Human Understanding, IV. xv. § 1.

2. Quantitatively, that character of an argument or proposition of doubtful truth which consists in the frequency with which like propositions or arguments are found true in the course of experience. Thus, if a die be thrown, the probability that it will turn up ace is the frequency with which an ace would be turned up in an indefinitely long succession of throws. It is conceivable that there should be no definite probability: thus, the proportion of aces might so fluctuate that their frequency in the long run would be represented by a diverging series. Yet even so, there would be approximate probabilities for short periods of time. All the essential features of probability are exhibited in the case of putting into a bag some black beans and some white ones, then shaking them well, and finally drawing out one or several at random. The beans must first be shaken up, so as to assimilate or generalize the contents of the bag; and a similar result must be attained in any case in which probability is to have any real significance. Next, a sample of the beans must be drawn out at random—that is, so as not to be voluntarily subjected to any general conditions additional to those of the course of experience of which they form a part. Thus, out-of-the-way ones or uppermost ones must not be particularly chosen. This random choice may be effected by machinery, if desired. If, now, a great number of single beans are so taken out and replaced successively, the following phenomenon will be found approximately true, or, if not, a prolongation of the series of drawings will render it so: namely, that if the whole series be separated into parts of two fixed numbers of drawings, say into series of 100 and of 10,000 alternately, then the average proportion of white beans among the sets of 100 will be nearly the same as the average proportion among the sets of 10,000. This is the fundamental proposition of the theory of probabilities—we might say of logic—since the security of all real inference rests upon it. The greater the frequency with which a specific event occurs in the long run, the stronger is the expectation that it will occur in a particular case. Hence, probability has been defined as the degree of belief which ought to be accorded to a problematical judgment; but this *conceptualistic probability*, as it is termed, is strictly not probability, but a sense of probability. Probability may be measured in different ways. The conceptualistic measure is the degree of confidence to which a reason is entitled; it is used in the mental process of balancing reasons pro and con. The conceptualistic measure is the logarithm of another measure called the *odds*—that is, the ratio of the number of favorable to the number of unfavorable cases. But the measure which is most easily guarded against the fallacies which beset the calculation of probabilities is the ratio of the number of favorable cases to the whole number of equally possible cases, or the ratio of the number of occurrences of the event to the total number of occasions in the course of experience. This ratio is called the *probability* or chance of the event. Thus, the probability that a die will turn up ace is $\frac{1}{6}$. Probability *zero* represents impossibility; probability *unity*, certainty. The fundamental rules for the calculation of probabilities are two, as follows: *Rule I.* The probability that one or the other of two mutually exclusive propositions is true is the sum of the probabilities that one and the other are true. Thus, if $\frac{1}{6}$ is the probability that a die will turn up ace, and $\frac{1}{6}$ is the probability that it will turn up an even number, then, since it cannot turn up at once an ace and an even number, the probability that one or other will be turned up is $\frac{1}{6} + \frac{1}{6} = \frac{2}{6}$. It follows that if p is the probability that any event will happen, $1 - p$ is the probability that it will not happen. *Rule II.* The probability of an event multiplied by the probability, if that event happens, that another will happen, gives as product the probability that both will happen. Thus, if a die is so thrown that the probability of its not being found is $\frac{1}{2}$, then the probability of its being found ace up is $\frac{1}{2} \times \frac{1}{6} = \frac{1}{12}$. If the probability that a certain man will reach the age of forty is p, and the probability, when he is forty, that he will then reach sixty is q, then the probability now that he will reach sixty is pq. If two events A and B are such that the probability of A is the same whether B does or does not happen, then, also, the probability of B is the same whether A does or does not happen, and the events are said to be *independent*. The probability of the concurrence of two independent events is the product of their separate probabilities. The probability that a general event, whose probability on each one of n occasions is p, should occur just k times among these n occasions, is equal to the term containing p^k in the development of $(p+q)^n$, where $q = 1 - p$. Thus, suppose the event is the appearance of head when a coin is tossed up, so that $p = q = \frac{1}{2}$, and the coin be tossed up six times. Then the probabilities of 0, 1, 2, 3, 4, 5, 6 heads respectively are $\frac{1}{64}$, $\frac{6}{64}$, $\frac{15}{64}$, $\frac{20}{64}$, $\frac{15}{64}$, $\frac{6}{64}$, $\frac{1}{64}$. The most probable value of k is that whole number next less than $(n+1)p$, unless this be itself a whole number, when it is equally probable. When the number of trials is large, the probabilities of the different numbers of occurrences of the given event are proportional to areas included between the so-called probability curve, its asymptote, and ordinates at successive distances equal to $1/\sqrt{2npq}$. This probability curve, whose equation is $y = \pi^{-\frac{1}{2}} e^{-x^2}$ (where π is the circumference for unit diameter, and e is the Napierian base), is represented in the figure, where the approximate straightness

Probability Curve.

of the slope will be remarked. If it is desired to ascertain the probability of the occurrence from k_1 to k_2 times inclusive in n trials of an event whose probable occurrence at each trial is p, the approximate value is the area included between the probability curve, the asymptote, and the two ordinates, for which

$$x = \frac{k_1 - (n+1)p}{\sqrt{2npq}} \text{ and } x = \frac{k_2 + 1 - (n+1)p}{\sqrt{2npq}}.$$

Twice the quadratures of the areas are given in treatises on probabilities as tables of the theta function of probabilities. A briefer form of the equation is $y = e^{-x^2}$, where the curve's asymptote is the axis of x. The chief practical application of probability is to insurance; and its only significance lies in an assurance as to the average result in the long run.

3. Anything that has the appearance of reality or truth.

Both the rocks and the earth are so splendent to behold that better judgements then ours might haue beene perswaded they contained more then *probabilities*.
Quoted in *Capt. John Smith's* Works, I. 115.

4. A statement of what is likely to happen; a forecast: applied in the plural by Cleveland Abbe to his daily weather-predictions in Cincinnati in 1869, and in Washington in 1871; later applied by General Myer to the official weather-predictions of the United States Signal Service. The same term had been similarly used by Leverrier, in Paris, since 1859.

The whole system [of meteorological predictions] is excellently organized and very extensive; the official publications embrace the *probabilities* and the so-called weather-maps. *Pop. Sci. Mo.*, XXIX. 546.

Antecedent probability. See *antecedent*.—**Balance of probabilities.** See *balance*.—**Calculus of probability**, a branch of mathematics teaching how to calculate probabilities by general methods.—**Curve of probability.** See above.—**Inverse probability**, the probability of a hypothesis as deduced from the comparison of its consequences with observation. Thus, the following is a familiar problem of inverse probability: Suppose a bag contains a series of tickets numbered consecutively from 1 up. Suppose a ticket is drawn at random, and its number is 13, what is the most probable number of tickets in the bag? The best opinion concerning inverse probability seems to be that it is altogether fallacious, unless the antecedent probability of the hypothesis is known. Some writers hold that the probability of a proposition about which we are completely ignorant is $\frac{1}{2}$; others hold that it is indeterminate.—**Local probability.** See *local*.—**Old Probabilities.** See *old*.

probable (prob'a-bl), *a.* and *n.* [< F. *probable* = Sp. *probable* = Pg. *provavel* = It. *probabile*, < L. *probabilis*, that may be proved, credible, < *probare*, test, examine: see *probe*, *prove*.] **I.** *a.* 1†. Capable of being proved; provable.

But it is to be remarked that, as so defined, the constant error belonging to all observations of the given series is not included in the probable error.—**Probable evidence**, evidence distinguished from demonstrative evidence in that it admits of degrees, and of all variety of them, from the highest moral certainty to the very lowest presumption.—**Probable inference.** See *inference*.—**Probable proposition.** See *proposition*.

In this latter and more common form it is entertained by members of various Protestant denominations. This doctrine is distinguishable from the doctrine of purgatory, or future disciplinary sufferings for the faithful, supposed to be necessary for their purification, and from the various forms of universalism, which holds that in a future probation all men will sooner or later accept the gospel.

The Standard, VII. 12.

Abating process. See *abate*.—**Abuse of process.** See *abuse*.—**Accessory process.** Same as *anapophysis*.—**Acromial** or **acromion process.** See *acromion*.—**Actinic process.** See *actinic*.—**Alar processes,** two small wing-like processes proceeding from the crista galli in front against the frontal bone, and partially including the foramen cæcum.—**Albumin process,** in *photog.* See *albumin*.—**Alinasal, alveolar, angular processes.** See the adjectives.—**Ammonia ore process.** See *ammonia*.—**Anconeus process.** Same as *olecranon*.—**Annular, anteorbital, auditory, autographic process.** See the adjectives.—**Articular process of the lower jaw.** See *articular*.—**Augustin's process,** a method of extracting silver from the ground chloridized ores of that metal, by the use of a solution of common salt. The silver chlorid, formed in the chloridizing roasting, is soluble in the saline solution, a double chlorid of silver and sodium being formed. From this solution the silver is precipitated by means of copper.—**Barff's process,** a method of protecting the surface of iron from rust by forming upon it a thin film of magnetic oxid. It is done by subjecting it at a red heat to the action of superheated steam.—**Basic process.** See *basic*.—**Basilar process.** See *basilar*.—**Basipterygoid processes.** See *basipterygoid*.—**Beer process,** in *photog.* See *beer*[1].—**Bessemer process,** a method, invented by Bessemer, of decarburizing cast-iron. It is of great importance, since by this process steel can now be made much more cheaply than was formerly possible. See *steel*.—**Bethell process,** a process for preserving wood, consisting in its impregnation with tar, oil of tar, and carbolic acid: this mixture is commercially known as *gallatin*, and is obtained by the distillation of coal.—**Bird's-head process,** one of the avicularia of a polyzoan, which are shaped and have a snapping motion like the beak of a bird.—**Bitumen process,** in *photog.* See *bitumen*.—**Boucherie's process,** the injection of a solution of sulphate of copper into the pores of wood.—**Burnettizing process,** the introduction of zinc chlorid into the pores of wood.—**Capitular, carbon, Carinthian process.** See the qualifying words.—**Cazo process** [Sp. *cazo*, a pan], in *metal.*, the treatment of silver ores in the moist way, with the aid of heat, which in the patio process is not used. See *patio process*.—**Chenot process,** a process, invented by the French metallurgist Chenot, for producing cast-steel. Wrought-iron in the form of a metallic sponge is first obtained directly from the ore by cementation with charcoal. This iron is then carburized by being impregnated with some liquid substance rich in carbon, then torrified, and finally melted in crucibles, as in the ordinary method of manufacturing cast-steel.—**Chlorination, chlorin, ciliary, clay, clinoid, cochleariform process.** See the qualifying words.—**Collodion process,** in *photog.* See *collodion*.—**Condyloid process.** Same as *articular process of the lower jaw*.—**Coracoid, coronoid, costal process.** See the adjectives.—**Cordurié's process,** a method of dezincification, by the use of superheated steam, of lead from which the silver has been separated by the Parkes process.—**Creosoting process,** the application of creosote to wood (especially telegraph-poles) for its preservation.—**Direct process.** See *bloomery*.—**Dry process.** (*a*) In *photog.*, the use of dry plates or films; specifically, the use of gelatinobromide emulsions as a sensitive coating for plates or films which are used in a dry state. See *photography*. (*b*) In *fish-culture*, a process of fecundating spawn, invented by V. P. Vrasski. It differs from the *moist process* by requiring two vessels, one for the spawn, which is placed in it without water, and the other for the milt, to which water is added to moisten the eggs. By the dry process, scarcely one per cent. of the eggs escape fecundation, while in the moist method ten or twelve per cent. of the spawn may be lost. (*c*) In *assaying*. See *assaying*.—**Due process of law.** See *due*[1].—**Eckart's process,** a method of preserving meats, game, fish, etc., by means of a solution of 1,240 parts salt, 10 parts saltpeter, and 25 parts salicylic acid in 8,725 parts of clean water, applied under a pressure of 180 to 200 pounds per square inch.—**Ensiform process.** Same as *metasternum*.—**Ethmoidal process,** a small projection on the posterior superior border of the turbinate bone for articulation with the uncinate process of the ethmoid.—**Executory process.** See *executory*.—**Falciform process.** Same as *falx cerebri* (which see, under *falx*).—**Fallacy of an illicit process.** See *fallacy*.—**Final process,** the writ of execution used to carry the judgment into effect.—**Flocculare process,** the flocculus.—**Foreign Process Acts.** See *foreign*.—**Fox-Talbot process.** Same as *Fox-type*, 1.—**Frontonasal, galvanoplastic, gelatin, geniculate, Ingrassian process.** See the qualifying words.—**Hamular process,** (*a*) Of the lacrymal bone, a hook-like projection at the lower extremity, curving forward in the lacrymal notch of the maxilla. This process has been extensively experimented with at Tarnowitz in Silesia, and in the Harz, and there abandoned. It has also been tried in other localities, and is (or was recently) in use to some extent in Japan. Also called *precipitation process*, a translation of the German name for it (*niederschlagarbeit*).—**Jugular process,** in man, a thickened part of the occipital bone to the back and outer side of the jugular fossa, articulating with the mastoid part of the temporal.—**Kenogenetic process.** See *kenogenetic*.—**Kyanizing process.** See *kyanizing*.—**Lacrymal process,** a small projection on the upper anterior border of the turbinate bone for articulation with the lacrymal bone.—**Le Blanc process.** See *soda*.—**Lenticular process.** See *incus* (*a*).—**Long process of the malleus,** a slender process received in the Glaserian fissure. Also called *paracondyloid process*.—**Parkes process,** a method of separating silver from lead by fusion with metallic zinc. When a molten mixture of these two metals is allowed to cool, the zinc separates and solidifies first, forming a crust on the other metal. If the lead contains silver, this is concentrated in the solidified crust of zinc, from which it may afterward be separated by distillation.—**Parotic process.** See *parotic*.—**Patera process.** See *Von Patera process*, below.—**Patio process** [Sp. *patio*, an open space], in *metal.*, a method of obtaining the silver from argentiferous ores by amalgamation, extensively practised in Mexico and South America. It is suited for ores in which the silver is present in the form of simple or complex sulphids without a large percentage of blende or galena, or more than three or four per cent. of copper pyrites. In this process the ore, ground by arrastres, is mixed with common salt, roasted copper pyrites (called *magistral*), and quicksilver. The whole mass is thoroughly mixed, usually by being trodden by mules, the result being that the silver becomes amalgamated with the quicksilver, and can then be easily separated. The mixing (as indicated by the name) takes place on large level floors in the open air.—**Pattinson process,** in *metal.*, a method of desilverizing lead, in former use in the treatment of argentiferous lead, and capable of being profitably employed even when the precious metal is present in the lead in so small quantity as two or three ounces to the ton of the baser metal. The process depends on the fact that melted lead containing silver solidifies gradually in cooling, small particles like crystals separating from the liquid mass, which latter is much richer in silver than the other part—the part which solidifies or crystallizes first yielding up a large part of its silver to that part of the lead which remains fluid. By repetitions of the operation, the remaining lead becomes at last so enriched with silver that this metal can be separated. The process, which was of importance in the treatment of argentiferous galena, has now been abandoned for the Parkes process. It was invented by Hugh Lee Pattinson of Alston in Cumberland, and was first applied on a scale of some magnitude in 1833. Before this invention silver had always been separated from lead (these two metals being almost always found associated together in nature) by cupellation, through which process a proportion of silver less than about eight ounces to the ton of lead could not be separated with profit. The process is sometimes called *pattinsonization*.—**Pectineal, phalangeal, photolithographic process.** See the adjectives.—**Photogelatin process,** in *photog.*, any process in which gelatin plays an important part, as in the ordinary gelatinobromide dry plates and films.—**Plaster process.** See *plaster*.—**Plattner's process,** a method of separating gold from pyrites by the employment of chlorin gas, by which the gold is converted into a soluble chlorid, which can then be washed out with water, and precipitated by sulphureted hydrogen in the form of a sulphuret, from which combination the precious metal is easily obtained. See *chlorination*.—**Polychromatic, postauditory, postfrontal, post-tympanic, prepubic process.** See the adjectives.—**Precipitation process.** Same as *iron-reduction process*.—**Process acts,** United States statutes of 1789 and 1792 (1 Stat. 93, 275), the first requiring the writs, executions, and other processes of the United States courts in suits at law to conform to those used in the supreme courts of the several States where such courts were held, except as to their style and teste. The second, in effect, reënacted the first, but allowed the courts or the Supreme Court of the United States by rule to make such alterations or additions as might seem expedient, and regulated the fees of court-officers, etc.—**Process caption.** See *caption*.—**Process of augmentation.** See *augmentation*.—**Process work,** any form of relief-printing plate made by photographic or etching processes, and not by cutting with a graver. See *photo-process*.—**Prosternal, pterygoid,** etc., **process.** See the adjectives.—**Pyramidal process.** Same as *tuberosity of the palate-bone*.—**Russell's process,** a modification of the Von Patera process for the separation of silver from its ores. The peculiarity of the process depends on the fact that a solution of thiosulphate of copper and soda has a powerful decomposing influence on the sulphureted, antimoniureted, and arseniureted combinations of silver. The roasted ore is first lixiviated with sodium thiosulphate to dissolve the silver chlorid, and afterward with copper thiosulphate. This latter solvent is called the "extra solution," and by its use an additional amount of silver is saved, which would otherwise have been lost in the tailings.—**Short process of malleus,** a small conical eminence at the root of the manubrium. Also called *processus brevis, obtusus, externus, cmoideus*, or *secundus*, or *tuberculum mallei*.—**Siemens-Martin process.** See *steel*.—**Siemens process.** See *steel*.—**Solvay process.** See *soda*.—**Sphenoidal process,** the posterior of the two processes surmounting the vertical plate of the palatebone. (*b*) A short, stout, pyramidal process projecting downward from the outer part of the distal extremity of the radius. (*c*) A short cylindrical eminence at the inner and back part of the distal extremity of the ulna. (*d*) A long, slender, tapering process projecting downward and forward from the outer part of the under surface of the petrous portion of the temporal bone: it is developed from independent centers of ossification, corresponding to the tympanohyal and stylohyal bones.—**Supracondylar process,** a small hook-like process, with its point directed downward, not unfrequently found in front of the internal condylar ridge of the humerus in man. It represents a part of the bone inclosing a foramen in carnivorous animals.—**Thomas-Gilchrist process.** Same as *basic process*.—**To obstruct process.** See *obstruct*.—**Trustee process.** See *garnishment*, 2 (*b*).—**Turbinate process.** (*a*) Superior, a short sharp margin of the ethmoid overhanging the superior meatus. (*b*) Inferior, the folded margin of the sphenoid overhanging the middle meatus. Also called *superior* and *middle spongy bones*.—**Uchatius process,** a method of making steel which has been tried in various places, but is not in general use. It consists in decarburizing pig-iron by fusing it with a material which will give up oxygen, especially iron peroxid or roasted spathic ore.—**Uncinate process.** See *processus uncinatus*, under *processus*.—**Vaginal process.** (*a*) Of the sphenoid, a slightly raised edge at the base of the internal plate of the pterygoid, articulating with the everted margin of the vomer. (*b*) Of the temporal, a flattened plate of bone on the under surface of the petrous portion, immediately back of the glenoid fossa, and partly surrounding the styloid process at its base.—**Vermiform process,** the elevated median portion or lobe between the hemispheres of the cerebellum—that portion on the upper surface being known as the *superior*, that on the under surface the *inferior*.—**Von Patera process,** a method of separating silver from its ores, after a chloridizing roasting, by means of a solution of hypophosphite of soda or lime, which takes up the chlorid of silver, from which solution the metal can be precipitated by an alkaline sulphuret.—**Washoe process,** in *metal.* See *pan*[1], 3.—**Wet process,** in *photog.*, the collodion process.—**Ziervogel's process,** the separation of silver from the sulphate by lixiviation with hot water containing some sulphuric acid. It is used in the treatment of argentiferous copper mattes in which the silver has been transformed into the sulphate by a peculiar kind of roasting. This process is one of very limited application, as great skill is required for the management of the roasting, and but few silver ores can be profitably treated by the method.—**Zygomatic process,** a horizontal bar, directed forward from the squamous part of the temporal bone, and articulating in front with the malar. Also called *zygoma*.—**Syn.** *Process, Proceeding, Procedure, Operation.* In this connection *process* applies to a way of doing something by rule or established method: as, the Bessemer *process*; the *process* of drilling an artesian well; a legal *process*. *Proceeding* expresses a complex action making a whole: as, it was a very strange *proceeding*. Jefferson and Cushing, in their manuals of parliamentary *procedure*, use *proceeding*, perhaps as a participial noun, where *procedure*, being more exact, would be the better word. *Procedure* applies to a way of doing things formally; a legal *proceeding* is a thing done legally; a legal *process* is a legal form gone through for the attainment of a definite purpose; legal *procedure* is the way of doing things in the administration of law, as in the courtroom; a legal *procedure* is a less desirable form of expression for a legal *proceeding*. *Operation* may be used for the way in which a thing works or operates: as, the *operation* of a nail-making machine; it is rarely used thus of personal activity, except in a bad sense: as, the *operations* of a gang of thieves. See *act*, *v. i.*

As standing for the thing or things produced, *produce* applies now almost exclusively to the raw *products* or yield of land: as, to bring fresh *produce* to market. Where Jonathan Edwards spoke of regarding "all free actions as the *produce* of free choice," we should speak now of regarding them as the *products* of free choice, or, better, as its effects. There is a lingering use of *produce* in such expressions as "the *produce* of a tax," but better now the *product*, or, still better, the proceeds. The word is always collective; we do not speak of *a produce*. *Product* and *production*, on the other hand, are particular. *Product* is the most general of the three words, but expresses the result of some operation, generally, but not necessarily, physical: as, the apple is especially an American *product*; Great Britain exports chiefly manufactured *products*. Thus, the word may apply to almost anything where emphasis is laid upon the fact of its being produced by some cause, especially by some cause that is named; but, apart from this, the word is applied chiefly to things having a material value, covering *produce*, manufactures, etc. *Production* applies now almost exclusively to the visible results of the operation of mind or the handiwork of art, as a book, a poem, an oration, a statue, a painting, a piece of needlework—the act or fact of producing being only subordinate in mind. *Product* is also a technical word of mathematics, but the others are not.

The first three words express offenses, amounting almost or quite to outrages, against the religious sentiment, in connection with places, days, etc., taking off their sacred character. 3. The calling or occupation which one professes to understand and to follow; vocation; specifically, a vocation in which a professed knowledge of some department of science or learning is used by its practical application to affairs of others, either in advising, guiding, or teaching them, or in serving their interests or welfare in the practice of an art founded on it. Formerly theology, law, and medicine were specifically known as *the professions*; but, as the applications of science and learning are extended to other departments of affairs, other vocations also receive the name. The word implies professed attainments in special knowledge, as distinguished from mere skill; a practical dealing with affairs, as distinguished from mere study or investigation; and an application of such knowledge to uses for others as a vocation, as distinguished from its pursuit for one's own purposes. In professions strictly so called a preliminary examination as to qualifications is usually demanded by law or usage, and a license or other official authority founded thereon required. In law the significance of the word has been contested under statutes imposing taxes on persons pursuing any "occupation, trade, or profession," and under statutes authorizing arrest in civil actions for misconduct in a "professional employment"; and it has been, in the former use, held clearly to include the vocation of an attorney, and upon the same principle would doubtless include physicians, unless the mention of trade, etc., in the same clause of the statute be ground for interpreting the statute as relating only to business vocations. Professional employment, in statutes allowing arrest, is regarded as not including a private agency like that of a factor or a real-estate broker, which can be taken up and laid down at pleasure.

Of your *profession*. Speak, what trade art thou?

3. A public teacher in a university, especially one to whom this title has been formally granted. The title, now the highest that a teacher can receive, appears to have originated in the Italian universities. In Oxford and Cambridge, the professors, and the instruction which they convey by lectures, are only auxiliary instead of principal agents, the routine work of instruction being carried on by the tutors connected with the several colleges. In the universities of Scotland and Germany, on the other hand, the professors are at once the governing body and principal functionaries for the purposes of education. In American universities there is generally a professor at the head of each department of instruction, having often other professors and assistant professors under him. The title is often given, also, to teachers of special branches in secondary schools, and locally to principals of common schools (a use derived from the French).

Beneath the machine is suspended a pendulum always hanging vertically, and serving to actuate a pencil the point of which rests on the paper and leaves a trace upon it. Any inequality of the surface causes the machine to incline from the level, and produces a corresponding deviation from a straight line in the mark traced by the pencil. The data obtained from these indications are sufficient for reproduction to scale of the profile traversed.

profit (prof'it), *n.* [< ME. *profit, profet, proffit, proffet, prophete* = D. *profijt* = G. Sw. 3. Specifically, the advantage or gain resulting to the owner of capital from its employment in any undertaking; the excess of the selling price over the original cost of anything; acquisition beyond expenditure; pecuniary gain in any action or occupation; gain; emolument: in commerce commonly used in the plural. In *polit. econ.,* the term *profit* was at first used to designate the net return left in the hands of a producer after deducting wages, rent, the value of materials consumed, and fixed capital destroyed. Modern economists deduct also normal interest on capital, whether borrowed or owned by the producer, and many of them deduct also a sum sufficient to insure against risks and to cover normal wages of management. Any surplus remaining, due to unforeseen price fluctuations, etc., to fruitful inventions, or to exceptionally successful management, is profit. The terms *net profit* and *pure profit* are sometimes used in this sense. When the profit becomes permanent through the existence of monopoly conditions, it is often termed *monopoly profit. Profits* in the law of real property designate rights of taking something off or out of the land, as, for instance, the right of common, as distinguished from *easements,* such as ways and access of air and light, which do not involve this.

The joints of a tapeworm, for example, are proglottides. This is what makes tapeworms such formidable parasites and so difficult to eradicate. For they are continually budded off from the scolex or "head" (really the whole worm), to the number sometimes of hundreds, like successive links of a chain; each such link or "joint" contains all the sexual elements, and is thus capable itself of starting a new series of the parasites in the eggs it produces. See cut under *Cestoidea.*

Each segment [of a tapeworm] is eventually found to contain a set of male and female organs. . . . At the extreme end of the body the segments become detached, and may for some time retain an independent vitality. Human *progress* is gradual, by slow degrees, evil by degrees yielding to good, the spiritual succeeding the natural by almost imperceptible processes of amelioration.

II. *n.* **1.** A body projected, or impelled forward by force, particularly through the air. Thus, a stone thrown from the hand or a sling, an arrow shot from a bow, and a ball discharged from a cannon are projectiles. The path of a projectile, or its trajectory (neglecting the effect of air-resistance), is a parabola.

The motion of a *projectile*—that is to say, of a body thrown in any direction and falling under the influence of gravity—was investigated by Galileo.
W. K. Clifford, Lectures, II. 13.

2. Specifically, a missile intended to be projected from a cannon by the explosive force of gunpowder or some similar agent. Projectiles used in smooth-bore guns are usually spherical, though sometimes oblong, as is the case in the Manby, Parrott, and Lyle life-saving projectiles. Projectiles for rifled guns are oblong, the cylindroconoidal form being generally adopted. It is essential for the range and accuracy of such a projectile that it should pass through the air in the direction of its longer axis, and the only certain method of effecting this is to give it a rapid rotary motion about this axis. To this end the projectile must be so prepared that it will engage and follow grooves in the bore of the gun. This is done in several ways: (*a*) By the *flange system*, in which the projectile is provided with flanges, studs, or buttons made of a soft metal, as copper, zinc, or brass, which fit into the grooves of the bore. (*b*) By the *expansive method*, often called the *American system*, in which the projectile is fitted with an expanding device made of softer material, such as brass, copper, or papier-maché, which is wedged into the grooves by the explosive force of the charge. This system requires more and shallower grooves than the flange system. Both the preceding methods are applicable to muzzle-loaders. (*c*) By the *compressive system*, in which the projectile is surrounded by a soft metal band or jacket, the diameter of which is greater than that of the bore without the grooves, the projectile being forced into and through the rifled part of the bore by the explosive force of the charge. The lands in the bore cut grooves in the encircling bands, which center and give rotation to the projectile. The rifling is polygroove and shallow, sometimes narrowing toward the muzzle. This system is in use in breech-loading guns.—**Armor-piercing projectile**, a projectile adapted, by its material and by special methods of hardening its point, to pierce modern armor-plate. A great advance in power of penetration has been secured by placing upon the point of the shell a soft metal cap which protects it from being broken by the hardened surface of the plate.—**Amplitude of the range of a projectile.**—See *amplitude*.—**Deviation of a projectile.**—See *deviation*.—**Horizontal range of a projectile.** See *horizontal*.—**Subcaliber projectile**, a projectile made of less diameter than that of the bore of the piece from which it is fired, but having a cup or disk large enough to fill the bore, allowing the ordinary windage; or it may have a cup or disk capable of being forced out to fill the bore when the gun is discharged. A high initial velocity is obtainable in subcaliber projectiles, for while their weight and hence inertia are much less than those of the full-sized shot, the area acted upon by the expanding gases is the same.—**Theory of projectiles**, that branch of mechanics which treats of the motion of bodies thrown or driven by an impelling force from the surface of the earth, and affected by gravity and the resistance of the air, as the motion of a cannon- or rifle-ball, or of a jet of water, etc.

★**projection** (prō-jek'shon), *n.* [< F. *projection* = Sp. *proyección* = Pg. *projecção* = It. *projezione*, < L. *projectio(n-)*, a throwing forward, a stretching out, < *projicere*, *proicere*, pp. *projectus*, throw forth: see *project*.] **1.** The act of projecting, throwing, or shooting forward: as, the *projection* of a shadow upon a bright surface; hence, the act or process of throwing, as it were, something that is subjective into the objective world; the act of giving objective or seeming reality to what is subjective: as, the *projection* of a sensation of color into space as the quality of an object (a colored thing).—**2.** That image or figure which results from the act of projecting an idea or a sensation.

A little cloth. *Shak.*, Hen. V., ii. 4. 46.

5. (*a*) In *geom.*, the act or result of constructing rays or right lines through every point of a figure, according to certain rules. These rays are called *projecting rays*. In *central projection*, often called *projection* simply, the projecting rays all pass through one point called the *center of projection*. In this way a point is projected into a ray, a straight line into a plane. In *axial projection*, a plane, called a *projecting plane*, is passed through every point of the figure, all these planes containing one line called the *axis of projection*. (*b*) The act or result of constructing rays through every point of a figure, all passing through one point, and cutting these rays by a plane or other surface, so as to form a section on that surface which corresponds point for point with the original figure. (*c*) In *chartography*, the act or result of constructing a figure upon a plane or other surface, which corresponds point by point with a sphere, spheroid, or other figure; a map-projection (which see, below).—**6.** The mental operation in consequence of which objects of the imagination or retinal impressions appear to be seen external to us.

Le Conte, Sight, p. 71.

7. In *alchemy*, the act of throwing anything into a crucible or other vessel, especially the throwing of a portion of philosopher's stone upon a metal in fusion with the result of transmuting it; hence, the act or result of transmutation of metals; humorously, the crisis of any process, especially of a culinary process.

Center of projection. See def. 5 (*a*).—**Central projection.** See *central* and def. 5 (*a*).—**Cylindrical projection.** See *map-projection*.—**Gauche projection.** See *gauche*.—**Geometric projection**, a parallel perspective projection equally inclined to the three principal axes of the body to be represented, as a machine.—**Homolographic, horizontal, imaginary, isometric, loxodromic projection.** See the adjectives.—**Globular projection.** See *map-projection*.—**Map-projection**, a system of continuous correspondence between the points of a spherical or spheroidal surface and those of a plane, this correspondence determining what points on a map represent given points on the earth, and conversely. Of the systems in use, only a small number are perspective representations (or rather perversions of such representations), so that the word *projection* must here be understood in a peculiar technical sense, not implying any simple geometrical relation between the sphere and the plane. The theory of projections is in itself one of the most scientific branches of applied mathematics; it may, indeed, be said to be simply the theory of functions viewed under the strong perspective of a practical standpoint. But only certain parts of the subject, such as the theory of orthomorphic projections, have as yet taken scientific shape. No satisfactory classification of map-projections is known; but orthomorphic, equivalent, zenithal (including the perspective), meridional, and conical projections are some of the main kinds. The following are the more important: *Airy's map-projection.* See *map-projection by balance of errors.*—*Albers's map-projection*, an equivalent map-projection in which the entire sphere appears as the space bounded by two lines and by two arcs of circles having their center at the intersections of these lines, these two arcs representing the infinitesimal parallels about the poles. The other parallels are concentric arcs having the same boundaries, and the meridians are straight lines radiating from the center. This map-projection was invented by H. C. Albers in 1805, and has been used for the map of Europe by Reichard.—*Apianus's map-projection*, a discontinuous map-projection in which the equator is represented by a limited straight line, and one of the meridians by a circle whose center bisects that line, while its circumference bisects each half formed by the first bisection; then, the semi-meridians toward the center are represented by arcs of circles cutting the equator orthogonally at equidistances, and bisecting the first circle at the points most distant from the equator; but the semi-meridians more distant from the center are represented by semicircles of the same radius as the full circle, and cutting the equator orthogonally at the same distances as the inner meridians; and the parallels are represented by equidistant straight lines parallel to the equator. This map-projection was much used in the sixteenth century, having been introduced by Peter Bennewitz or Apianus in 1524.—*Arago's map-projection*, a map-projection in which one of the meridians is a circle, and the parallels are parallel straight lines dividing the circumference of this circle into equal arcs, while the other meridians are ellipses dividing the parallels into equal parts. This projection was invented by the French astronomer Arago in 1834.—*Arrowsmith's map-projection.* See *globular map-projection* (*b*).—*Babinet's map-projection.* See *homolographic map-projection*.—*Bennewitz's map-projection.* Same as *Apianus's map-projection*.—*Bonne's map-projection*, an equivalent map-projection in which all the parallels are represented by concentric and equidistant arcs of circles, and the central meridian by a straight line, the central parallel being cut orthogonally by all meridians. The entire spheroid appears in a kidney shape. This map-projection was invented by Ptolemy, and described in his geography, although his rules for drawing it did not contemplate a degree of precision which the geographical knowledge of his time would not warrant. It was extensively used during the sixteenth century. It bears the name of the French geodesist Bonne, who improved the theory of it. It has been employed in several of the government maps of European countries. Also called *modified Flamsteed's map-projection*.—*Boole's map-projection.* Same as *Lagrange's map-projection*.—*Broken map-projection.* Same as *discontinuous map-projection*.—*Cassini's map-projection*, an equivalent map-projection, the development of a cylinder tangent to the sphere along a meridian, upon which cylinder the sphere has been orthogonally projected from the axis of the cylinder. This projection was used for Cassini de Thury's great map of France, of which the publication was begun in 1745.—*Central equivalent map-projection.* Same as *isomeric map-projection*. It was proposed by J. H. Lambert.—*Central map-projection.* (*a*) Same as *gnomonic map-projection*. (*b*) Same as *zenithal map-projection*.—*Clarke's map-projection*, a perspective map-projection in which the distance of the eye from the center of the sphere is 1.368 times the radius. This projection was invented by the English geodesist Colonel A. R. Clarke.—*Collignon's map-projection.* (*a*) The quadrilateral map-projection. Let r and θ be the polar coördinates of any point on the polar stereographic projection, let i denote the imaginary whose square is -1, and let F denote any function having a differential coefficient. If, then, $F(r\cos\theta + r\sin\theta . i)$ be put into the form $x + yi$, x and y will be the rectangular coördinates of the corresponding point on another orthomorphic projection. In law, a promise is not binding in such sense as to be directly enforceable through the courts, unless made upon a consideration good or valuable; in which case the promise and the consideration together form a contract or agreement (if under seal, termed a *covenant*) which binds the promisor, and it may be his legal representatives, and gives the promisee, and in some cases a third person for whose benefit the promise was made, the right to enforce it by suit, or to recover damages for its breach.

An *offer* is not binding till it is accepted; a *promise* is binding as soon as it is known by the party it is made to.—**Special promise**, an actual promise as distinguished from an implied promise.—**The Promise**, according to the account given in the Bible, the assurance given by God to Abraham that his descendants should become the chosen people, and that in him all the families of the earth should be blessed.

Scott, Ivanhoe, xxxii.

To give a lick and a promise of better. See *lick.*

=Syn. 1. *Assurance, Promise, Engagement, Pledge, Covenant.* These words are arranged in the order of strength; it would be dishonorable to fail to keep what even the weakest of them expresses. The formality and solemnity of each are proportioned to its strength. A *covenant* is a mutual obligation; the others are not. pronghorn (prông'hôrn), *a.* and *n.* **I.** *a.* Having horns with a prong or snag, as the prongbuck: as, the *pronghorn* antelope.

II. *n.* The prongbuck or cabrit. This remarkable animal is an isolated American type, like the saiga of the Old World; it has no near relatives living, and is supposed to be in the line of descent from some stock more or less like the fossil *Sivatherium* of India. It is not an antelope in any proper sense, though universally so called in the regions it inhabits — the first literary use of the name dating about 1812. The pronghorn was first scientifically described from material furnished by Lewis and Clarke to George Ord, who called it *Antilope americana* in 1815, but very soon instituted the genus *Antilocapra* (which see, and *Antilocapridæ*, for technical characters). The male stands about 3 feet high at the croup and withers; the limbs are very slender; the general form is that of a deer, but rather stouter (contrary to a general impression); the eyes are extremely large and full, and placed directly under the base of the horns; these in the male are from 6 or 8 inches to a foot in length, curved variously, but always with the characteristic prong or snag — in the female mere hairy cones tipped with a horny thimble an inch long. The horns are shed annually, late in the fall or early in winter. The pelage is close, without any flowing tufts, but coarse and brittle, and nearly worthless; the hide makes a valuable buckskin when dressed. The venison is excellent, resembling mutton rather than deer-meat. There is an extensive set of cutaneous sebaceous glands, eleven in number, which during the rut exhale a strong hircine odor. The prongdoe regularly drops twins, usually late in spring or early in summer, and the kids are not spotted (as the young of *Cervidæ* usually are), but resemble their parents. The bucks and does are alike of a tawny or yellowish-brown color, with a large white disk on the buttocks, a white crescent and triangle on the fore part of the neck, and the under parts and inner sides of the limbs white; the forehead, muzzle, a spot on the neck over the gland, and the horns and hoofs are mostly black or blackish. During most of the year the animals go in bands, sometimes numbering thousands, but oftener of much less extent. They range over all the region of the great plains, from British America far into Mexico, excepting where they have of late years been driven off by the settlement of the country. Unlike the bison, the pronghorn did not in recent time range east of the Mississippi. It is noted for its fleetness, and for a singular mixture of timidity and curiosity, which renders it susceptible of being "flagged," or decoyed within rifle-range by the exhibition of any unusual object, as a handkerchief tied to a pole. The gait is buoyant and easy, and when bounding at full speed the animal is probably the fleetest of any American game. But it lacks bottom, and its astonishing bursts of speed cannot be long sustained. Almost any pack of hounds can overtake it, if the game has not too much advantage at the start. The pronghorn is subject to an epidemic disease of unknown character, which in some years has destroyed many thousands. This fact, together with the incessant persecution it suffers, has very appreciably diminished its numbers as well as contracted its range of late years, though it appears to be still very far from the point of extermination.

Pronunciation of Greek and Latin. (*a*) *Continental pronunciation* or *system of pronunciation*, a system of pronunciation of Latin or Greek conforming or approximating to that in use on the continent of Europe, especially in the vowel-sounds. As each of the principal nations in western Europe pronounces Latin, and the most of them Greek also, in the main after the analogy of its own language, it is only in their chief points of agreement that a usage which can justify this epithet *continental* exists. The system of pronunciation known as *continental* retains, for the most part, the English sounds of the consonants, and pronounces the vowels as in German or Italian. There is a stricter form of continental pronunciation of Latin, approaching the Roman, and a modified form, approaching the English. The continental system of pronouncing Greek is often called *Erasmian*, as closely resembling the modified or modern Erasmian pronunciation used in Germany. (*b*) *Eclectic pronunciation* (*of Greek*), a system of pronunciation of ancient Greek which seeks to approximate to the actual ancient pronunciation. It agrees on the whole with the stricter continental system, and pronounces the diphthongs so that each element can be heard separately. (*c*) *English pronunciation* (*of Greek*), a system of pronouncing Greek with the English sounds of the corresponding Latin letters. This system is now little used in the United States. (*d*) *English pronunciation* (*of Latin*), a system of pronouncing Latin which follows, with some exceptions, the general analogy of the modern pronunciation of English. The Latin rule of accentuation determines the place of the accent; but the vowels are given their long or short English sounds without regard to their Latin quantity. The English long sounds are used at the end of a word (but final *a* is usually obscure, as in *coma*), before another vowel, and at the end of an accented penult or of any unaccented syllable (except penultimate *i*). The English short sounds are used in a syllable ending with a consonant (except final *es*, *os*), before two consonants (not a mute and liquid) and *x* (= *cs*), and (excepting *u*) in an accented antepenult before a single consonant, if not followed by two vowels the former of which is *e*, *i*, or *y*. *C*, *s*, and *t*, succeeding the accent, are equivalent to sh, and *x* is sounded like ksh, before two vowels the former of which is an unaccented *i* or *y*, unless *s*, *t*, or *x* precedes. Initial *x* is pronounced z. If the second of two initial consonants is not *h*, *l*, or *r*, the first (if not *s*) is silent. Initial *chth* and *phth* are pronounced th. There are no silent vowels. Different authorities vary these rules somewhat, or acknowledge various exceptions to them. The English system of pronunciation of Latin regulates the pronunciation in English of all proper names which have not altered their Latin spelling, and of all Latin words and phrases which have become Anglicized. (*e*) *Erasmian pronunciation* (*of Greek*), a system the earliest champion of which was Erasmus in his treatise "De Recta Latini Græcique Sermonis Pronunciatione" (Basel, 1528). The pronunciation universally in use at that time was the modern Greek as used in the middle ages and supported by Byzantine scholars at the time of the revival of letters. Investigation led to a general conviction among scholars in the west of Europe that the Erasmian theory of the ancient pronunciation was correct; and by the end of the sixteenth century — after considerable controversy, embittered by the fact that the traditional or modern pronunciation was favored by supporters of the papacy, and the Erasmian system by the Reformers — the Erasmian system had come into general use, and the Byzantine method of pronouncing Greek as a living language — also called the *Reuchlinian*, from Johann Reuchlin, the first great representative of Greek scholarship in Germany — became obsolete in the western schools. In its original form the Erasmian pronunciation was distinguished from the Reuchlinian by giving most of the vowels the sounds which they have in Latin as pronounced by most of the western nations, the Italians, Germans, etc., and by pronouncing the diphthongs so that each vowel in them should preserve its own sound. As, however, this pronunciation closely approached that of the modern western languages in the sixteenth century, it became practically the usage that every nation should pronounce Greek after the analogy of its own language, and, as this has gradually changed in each country, the pronunciation of Greek has varied with it. In England, in the time of Henry VIII., the pronunciation of vowels was nearly the same as in continental languages. This is evident from the fact that the relation of the Greek vowels, as pronounced by the Erasmian system, to those in the Latin alphabet, as used in the vernacular, is treated by writers of that time as identical in England and on the continent. In England, accordingly, the Erasmian system of pronunciation was insensibly transformed into what is now called the *English pronunciation* of Greek. The system known as the *continental* is a partial revision of the Erasmian; that designated as the *eclectic* restores the Erasmian with some alterations. (*f*) *Modern Greek pronunciation*, the pronunciation of Greek, ancient and modern, actually in use in Greece at the present day. The change from the ancient to the present pronunciation was very gradual. The first signs of its prevalence are found in the Bœotian dialect and among Hellenists. Confusion of ει with ι became general about 200–100 B. C., but good speakers still made some difference between these sounds till after 200 A. D. The vowel η began to be frequently confounded with ι about 250–150 B. C., but persons of culture retained the sound of a Latin ē (English ā) for it till 500 A. D. or later. The diphthong αι became identical in sound with ε about 150–200 A. D., and somewhat later οι was pronounced like *v* (ü). The vowel *v* was distinguished from ι till late Byzantine times. After about 150–200 A. D. αv, εv came to be sounded as av, ev, and later as af, ef before surds. During the Roman imperial period distinctions of quantity fell more and more into disuse, and merely accentual poetry began as early as the fourth century. In Egypt and other countries outside of Greece these changes of pronunciation began very early, and even the older manuscripts are accordingly full of their effects (*iotacisms*). This system of pronunciation prevailed throughout the middle ages not only in the East, but in the West till the time of the Reformation. Also called *iotacism*, *itacism*, *Reuchlinian pronunciation*. (*g*) *Reuchlinian pronunciation* (*of Greek*). Same as (*f*). See (*e*). (*h*) *Roman pronunciation* (*of Latin*), a system of pronunciation of Latin which seeks to approximate to the actual ancient pronunciation. It differs from the stricter continental system chiefly in the sounds given to *æ*, *œ*, *c*, and *v*, and in having only one sound for each vowel. In the ancient pronunciation *e* and *o* varied in sound, and there are indications that the short vowels in general differed somewhat in quality from the long vowels. The following tables exhibit the leading systems described above.

In all these systems κ, λ, μ, ν, π, ρ, σ, τ, φ, and ψ respectively have the same sounds as *k*, *l*, *m*, *n*, *p*, *r*, *s*, *t*, *f*, and *ps*. The sounds given in parentheses represent the stricter continental pronunciation. γ[2] is γ before γ, κ, ξ, χ (γ[1] being γ elsewhere); gh represents the corresponding sonant to ċh (nearly as German *g* in *Wagen* as pronounced by most Germans). In the Modern Greek system χ is ch as in German *ich*, and γ is y before ā and ē sounds (ε, ι, etc.); γκ is ngg, μπ is mb, and ντ is nd. The strict continental system and the Modern Greek pronounce by the written accent, while the English and the modified continental accent Greek by the rule for accent in Latin. The two last-named systems generally make α and ι long in open syllables and short in closed syllables (the English pronunciation treating them as *a* and *i* in Latin), but *v* is always long.

In all these systems *b*, *d*, *f*, *h*, *k*, *l*, *m*, *n*, *p*, *ph* (= *f*), *q* (*qu* = *kw*), *r*, *t*, *th* (in *thin*), have their ordinary English sounds. *C*[2] and *g*[2] represent *c* and *g* before *e*, *æ*, *œ*, *i*, and *y*; *c*[1] and *g*[1] represent *c* and *g* before other letters than these. The short vowel-sounds are used in the English and in the modified continental system in closed syllables, and the long vowel-sounds in open syllables, regardless of the ancient quantity. The Roman system gives the same quality of sound to a short vowel as to a long, but makes it more rapid in pronunciation. In continental pronunciation *s* is by some pronounced z between two vowels, and in the modified system final *s* is pronounced āz, and final ŏs ōs. For the pronunciation of *c*, *s*, and *t* as sh, and of *x* as ksh or z, see (*d*). Pronounce *ü* as in German, or as French *u*.

A dynamometer, named after its inventor, much used for obtaining data for computing the power delivered by turbines and other water-wheels, or from the fly-wheel of an engine, or transmitted by shafting. The principle of this apparatus is the same in all of its forms. In the accompanying illustration, which represents a form of the apparatus used in laboratories, *e* is a shaft provided with a winch *c*, and supported in bearings *d* in a frame *h*; *j* is a lever having a scale-pan suspended from the point *m* near the extremity of the longer arm as shown at *b*, on which, when in use, a weight or weights *i* are placed; *a* is a counterpoise; *f* is a chain connected at its ends to tightening-bolts *k*, *k′*; *l* indicates wooden brake-shoes, which, by tightening the chain *f*, can be made to press strongly against the projecting end of the shaft *e*; *g*, *g′* are stop-rests, which limit the motion of the lever, used only for convenience in applying the brake, and not essential to its action. In the determination of the power transmitted through the shaft *e*, moving in the direction shown by the arrow, the counterpoise is first adjusted to counterbalance the long arm of the lever and the empty scale-pan. The chain *f* is then tightened and the scale-pan loaded, so that at a given velocity the lever is by the friction of the brake held away from the rest *g′*, but not in contact with *g*. Under conditions so established, if L = the perpendicular distance in feet of the point *l* from the axis of *e*, S = the weight in pounds placed in the pan, *r* = the radius in feet or fractions of a foot of the shaft *e*, and M = the moment of torsion in pounds, then will LS/*r* = M, and 2π*r*M = the power transmitted in foot-pounds during each turn of the winch. Also called *Prony's brake*.

Prony's Dynamometer.

Which is our mightiest.

2. Evidence and argumentation putting the conclusion beyond reasonable doubt; demonstration, perfect or imperfect.

Trifles light as air
Are to the jealous confirmations strong
As *proofs* of holy writ. *Shak.*, Othello, iii. 3. 324.

They [miracles] are not private, but public *proofs*; not things to be done in a corner, for the sake of single persons, but before multitudes, and in the face of the sun.
Bp. Atterbury, Sermons, I. xii.

Credulous enough
To swallow much upon much weaker *proof*.
Cowper, Conversation, l. 722.

3†. A thing proved or tried; truth or knowledge gathered by experience; experience.

Have never wing'd from view o' the nest, nor know not
What air 's from home. *Shak.*, Cymbeline, iii. 3. 27.

4. The state of having been tested and approved; firmness, hardness, or impenetrability: specifically applied to arms or armor of defense, to note that they have been duly tested and are impenetrable.

Sir P. Sidney, Arcadia, iii.

She hath Dian's wit;
And, in strong *proof* of chastity well arm'd,
From love's weak childish bow she lives unharm'd.
Shak., R. and J., i. 1. 216.

They harnessed him from head to foot with what was of *proof*, lest perhaps he should meet with assaults in the way. *Bunyan*, Pilgrim's Progress, p. 124.

5. In *law:* (*a*) The convincing effect of evidence; the manifestation of the truth of a proposition by presenting the reasons for assenting to it; such an array of evidence as should determine the judgment of the tribunal in regard to a matter of fact. In criminal cases, to be effectual as proof, the evidence must satisfy beyond a reasonable doubt. In civil cases it is enough that the evidence preponderates.

Evidence is the medium of *proof*; *proof* is the effect of evidence. *Judge Danforth*, 108 N. Y., 73.

(*b*) *pl.* In equity practice, the instruments of evidence in their documentary form, as depositions, deeds, etc., received in a cause. (*c*) The presentation of sufficient evidence: as, the burden of *proof* lies with the plaintiff. *Proof* is either written or parole. The former consists of records, deeds, or other writings; the latter of the testimony of witnesses personally appearing in court or before a proper officer, and, as a rule, sworn to the truth of what they depose. In this sense the word is used to designate either the task of going forward with the giving of evidence at the trial or the task of satisfying the minds of the jury. Owing to the different functions of the judge and the jury, the distinction is of great practical importance, because when the plaintiff has given evidence which would entitle him if unanswered to go to the jury, it is proper for him to tell counsel that the burden of proof is on defendant, meaning that if the defendant adduces no evidence the plaintiff will be entitled to have the case submitted to the jury; but it is error for him thereupon, whether defendant offers evidence or not, to tell the jury that the burden of proof is on defendant to contradict plaintiff's case, for, considered as a task of satisfying the jury, the burden of proof remains upon the plaintiff throughout. The burden of proof is never on the defendant in this sense, except in respect to an affirmative defense in avoidance as distinguished from a denial. (*d*) In Scots law, the taking of evidence by a judge upon an issue framed in pleading. Sometimes disputed facts may be sent to a jury, but, except in actions of damages, a proof is almost invariably the course adopted. . . . The evidence as the proof is taken down in shorthand, and counsel are heard at the close. *Henry Goudy.*

6. A test applied to manufactured articles or to natural substances prepared for use; hence, the state of that which has undergone this test, or is capable of undergoing it satisfactorily. Compare *armor of proof.*—**7.** In alcoholic liquors, the degree of strength which gives a specific gravity of 0.920. See II., 2. Liquors lighter than this are said to be *above proof*, and heavier liquors are *below proof*. See *overproof* and *underproof*.

The expressions "20 per cent over proof," "20 per cent under proof," mean that the liquor contains 20 volumes of water for every 100 volumes over or under this fixed quantity, and that, in order to reduce the spirit to *proof*, 20 per cent of water by volume must be subtracted or added as the case may be. *Spons' Encyc. Manuf.*, I. 215.

8. In *printing*, a trial impression from composed type, taken for correction. Generally a number of successive proofs are read before the matter is ready for the press, corrections being made first in the printing-office until what is technically called a *clean proof* can be submitted to the author. The final proof is called a *press proof* or a *foundry-proof*, the first being used of letterpress work, and the latter of plate-work.

Lap. What says my printer now?
Gal. Here 's your last *proof*, sir. [Giving proof-sheet.] You shall have perfect books now in a twinkling.
Fletcher (*and another*?), Nice Valour, iv. 1 (circa 1625).

9. In *engraving* and *etching*, an impression taken from an engraved plate to show its state during the progress of executing it; also, an early and superior impression, or one of a limited number, taken before the title or inscription is engraved on the plate, and known as *proof before letter*. There may be first, second, and third proofs, marking successive states of the work. See also *artist's proof*, *India proof*, *proof with open letters*, and *proof with remarque*, below.

10. In *numis.*, any early impression struck at the mint from a coin-die used for producing the current coins of the realm. Proofs are often distinguished from the coins struck off for actual currency by having their edges left plain instead of being milled or inscribed. They are also often struck in a metal of greater or less value than that which is proper to the current coin: thus, there are gold, silver, and bronze *proofs* of the English copper farthing issued by George III. in 1799. Compare *pattern*, 8.

These remarks are sometimes used to denote the different states of the plate up to the point of completion.—**Pure proof.** See *pure*[1].—**To the proof†, to the quick;** so as to touch a vital part.

But now I'll speak, and *to the proof*, I hope.

Macaulay, Hist. Eng., vi.

2. Noting alcoholic liquors which have the specific gravity 0.91984, usually considered as 0.920, which is sufficiently accurate for practical purposes. See *proof*, *n.*, 6. In London a proof-house is established by law, to which gun-barrels of different makers can be sent for proof. Gun-barrels which meet the test are then stamped with authorized proof-marks.

proof-plane (pröf'plān), *n.* In *elect.*, a small thin metallic disk, insulated on a non-conducting handle, by which electricity may be carried from one place to another. It is used in experiments on the distribution of electricity on conductors. When it is laid against the surface whose electric density it is intended to measure, it forms, as it were, a part of the surface, and takes the charge due to the area which it covers, which charge may be carried to an electrometer and measured.

proof-press (pröf'pres), *n.* A printing-press used exclusively for taking proofs.

proof-print (pröf'print), *n.* An early impression of an engraving, taken with greater care than an ordinary print; a proof.

proof-printer (pröf'prin″tėr), *n.* In *engraving*, a skilled workman whose especial province is the printing of proofs from engraved or etched plates.

proof-reader (pröf'rē″dėr), *n.* A person who reads printers' proofs for correction; one whose occupation is to discover errors in proofs and note on them the necessary changes. A *critical* or *editorial proof-reader* is one who not only corrects the compositors' errors, but notes or points out the lapses of the original text, or makes or indicates changes for its improvement. Proof-readers were originally called *correctors of the press*, and that phrase still remains in literary or formal use, especially for those who read proofs for criticism as well as for correction.

proof-reading (pröf'rē″ding), *n.* The correction of errors in printers' proofs. See *proof-reader*. In marking a proof, the places in the text where changes are to be made are indicated in the following modes. A caret (∧) is inserted in the bottom of a line at a point where something is to be put in or a new paragraph is to be made; a line is drawn through anything to be taken out or changed for something else, and under anything to be changed to different type; the mark ⌐ is made to the left of a word to be shifted in that direction, and ⌋ to the right; and letters or parts of a word improperly separated are connected by a curve or curves (⌣ or ⊃). In the last two cases the same marking is repeated in the margin. The other indicative marks or signs made in the margin (besides a few strictly technical ones, which admit of much variation) are the following: ⸗ or ⸘ (*dele-mark*), representing *d* (δ) for *dele*, take out; ⅋ (*turn-mark*), for turning an inverted letter; # (*space-mark*), for inserting a space, or more space; ⏝, for putting down space; □, for inserting an em-quadrat, or increasing the space to that amount; ¶ (*paragraph-mark*), for making a new paragraph; ×, for a broken or imperfect letter; *stet* (let it stand), for something that is to remain after being crossed out, a row of dots being made under the erasure; *tr.* for *transpose*; *w. f.* for *wrong font* (meaning a letter or letters of different size or face from the others); *ital.* for *italic*, and *rom.* for *roman*; *cap.* or *caps.* for *capital* or *capitals*; *s. c.* for *small capitals*; *l. c.* for *lower-case*. In the last five cases, where only a single letter is involved, proof-readers usually write the letter itself in the margin, in the form desired, or with the proper underscoring. In underscoring, italics are indicated by a single line, small capitals by two lines, and capitals by three lines. A single letter written as a capital does not usually need to be underscored. Where two paragraphs in the text are to be joined or "run in," a line curving at the ends is drawn between them, and "No ¶" written in the margin. A marginal correction should always be written as nearly as possible opposite the place affected in the text; and where the connection cannot thus be made clear, a line should be drawn between the place and the correction.

proof-sheet (pröf'shēt), *n.* A printers' proof.

Mr. Arthur Pendennis having written his article, . . . reviewed it approvingly as it lay before him in its wet *proof-sheet* at the office of the paper.

It frequently remains distinct from the other otic bones; in man it assists the opisthotic in the formation of the mastoid as well as the petrous part of the temporal bone. See cuts under *Crocodilia, Gallinæ*, and *periotic.*

The *pro-otic* is, in fact, one of the most constant bones of the skull in the lower Vertebrata, though it is commonly mistaken on the one hand for the alisphenoid, and on the other for the entire petro-mastoid.

A principle common to all this class of propellers is that a vessel is moved forward by the reaction on the propeller of the water thrown rearward, the propelling machinery being at some part or parts rigidly attached to the ship. Dan. *profet,* < LL. *propheta, prophetes* = Goth. *praufētēs, praufētus,* < Gr. προφήτης, Doric προφάτης, one who speaks for a god, an interpreter (as Tiresias was of Zeus, Orpheus of Bacchus, Apollo of Zeus, the Pythia of Apollo), expounder (as those who interpreted the words of the inspired seers), proclaimer, harbinger (as the bowl is of mirth, or the cicada of summer), in the Septuagint an interpreter, spokesman, usually an inspired prophet, also a revealer of the future, in N. T. and eccl. an interpreter of Scripture, a preacher, < προφάναι, say before or beforehand, < πρό, before, in public, + φάναι, speak, say: see *fable, fame*[1], *fate.*] **1.** One who speaks by a divine inspiration as the interpreter through whom a divinity declares himself. In the times of the Old Testament there was an order of prophets, for the duties of whose office men were trained in colleges called *schools of the prophets.* The members of these schools acted as public religious teachers, and the prophets in the stricter sense (inspired teachers) generally belonged to this order. In the New Testament, Christian prophets were recognized in the church as possessing a charism distinct from that of mere teachers, and as uttering special revelations and predictions. They are often mentioned with apostles, and next after them in order.

Ihesus that sprong of iesse roote,
As us hath prechid thi *prophete.*
Hymns to Virgin, etc. (E. E. T. S.), p. 12.

The word *prophet* (προφήτης) was derived in the first instance from the interpreters of the will of the gods (see Pindar, N., i. 91); later and especially it was applied to those who expounded the unintelligible oracles of the Pythoness of Delphi, or the rustling of the leaves of Dodona. In a metaphorical sense it was used of poets, as of interpreters of the gods or Muses. It was then adopted by the Septuagint as the best equivalent of the *nabi* or *prophet* of the Old Testament. . . . In all these cases (Acts ii. 17, 18; xiii. 1; xv. 32; Rev. i. 3; xi. 3, 6, 10, 18; xvi. 6; xviii. 20, 24; xix. 10; xxii. 6, 7, 9, 10, 18), in the New Testament as in the Old, and it may be added in the Koran, the prominent idea is not that of prediction, but of delivering inspired messages of warning, exhortation, and instruction; building up, exhorting, and comforting: convincing, judging, and making manifest the secrets of the heart (1 Cor. xiv. 3, 24, 25). The ancient classical and Hebrew sense prevails everywhere. Epimenides and Mahomet on the one hand, Elijah and Paul on the other, are called *prophets,* not because they foretold the future, but because they enlightened the present.
A. P. Stanley, Com. on Corinthians, p. 243.

2. One who foretells future events; a predicter; a foreteller; especially, a person inspired to announce future events.

As he spake by the mouth of his holy *prophets,* which have been since the world began: That we should be saved from our enemies, and from the hand of all that hate us. Luke i. 70.

Polybius was of the best sort of *prophets,* who predict from natural causes those events which must naturally proceed from them. *Dryden,* Character of Polybius.

That never shadow of mistrust can cross
Between us. *Tennyson,* Geraint.

3. An orthopterous insect of the family *Mantidæ.* [Local, U. S.]—**French prophets,** a name sometimes given in England to the Camisards.—**Major prophets,** Isaiah, Jeremiah, Ezekiel, and Daniel; also, the books of their prophecies in the Old Testament.—**Minor prophets,** the writers of the Old Testament from Hosea to Malachi inclusive; also, their books. The distinction between *major* and *minor* relates to the size of the books.—**School of the prophets,** among the ancient Jews, a school or college in which young men were educated and qualified to be public teachers. One elderly or leading prophet presided over them, called their *father* or *master;* hence the students were called *sons of the prophets.* Their chief subject of study was the law and its interpretation, but music and sacred poetry were subsidiary branches of instruction.—**The Prophets,** those books of the Old Testament which are largely composed of prophecies, or which were written or compiled by members of the order of prophets. The ancient Jews sometimes divided the Old Testament into the Law (Pentateuch) and the Prophets, and sometimes (as still in Hebrew Bibles) into Law, Prophets, and Hagiographa. In Hebrew Bibles the *Former Prophets* are Joshua, Judges, I. and II. Samuel, and I. and II. Kings; the *Latter Prophets* are the books from Isaiah to Malachi inclusive, with the exception of Lamentations and Daniel, which are placed in the Hagiographa.

On these two commandments hang all the law and *the prophets.* Mat. xxii. 40.

=**Syn. 1.** *Prophet, Seer, Soothsayer.* A *prophet* is properly one who discloses or speaks forth to others the will of God; a *seer* is one who has himself learned God's will by a vision. Both titles were applied in the Old Testament to the same class of men, but at different times. The extra-Biblical uses of the words correspond to the Biblical. The word *prophet* is sometimes used in the Bible of a candidate for the prophetic office, or of an inspired preacher or interpreter. *Soothsayer,* as used in the Bible, implies imposture, and in other literature its standing is little better.

Beforetime, in Israel, when a man went to enquire of God, thus he spake, Come, and let us go to the *seer:* for he that is now called a *Prophet* was beforetime called a *Seer.* 1 Sam. ix. 9.

1 John ii. 2.

=**Syn.** *Atonement, Reconciliation, Propitiation, Expiation, Satisfaction.* By derivation and by Biblical usage *atonement* and *reconciliation* are essentially the same: two that were alienated are made at one, or put back into friendship. *Atonement*, however, is not now applied to the relation of man to man, except in its extra-Biblical extension, by which it means also the making of full and satisfactory amends (*satisfaction*) or the enduring of proper penalties (*expiation*) for a great wrong. as, there could be no *atonement* for such an outrage. As applied to the relations of God and man, *atonement* has been lifted into much greater dignity than any other word in the list; it is now the august, chosen, and only endeared word for the effect of the life and especially of the death of Christ in establishing right relations between God and man; *reconcile* and *reconciliation* are the principal words for this in the New Testament, *atonement* being used only once, and *atone* not at all. *Propitiation* is the only one of these words having exclusive reference to the feelings or purposes of the person or being offended; it is a severe word, implying slowness to relent, and is, in regard to the attitude of God toward man, chiefly a theological term. *Expiation* regards the guilt of the offense; it is the suffering of the penalty proper for an act (as, to make *expiation* for one's crime upon the scaffold), or of an adequate substituted pain. The word is general, and only barely Biblical (Num. xxxv. 33, margin, and revised version), although the fact is by the mass of Christians believed to lie in some form in the sufferings of Christ. *Satisfaction* in this connection means adequate amends: as, *satisfaction* for an insult or for damage; the word has been taken by a school in theology to express the sufficiency of the sufferings of Christ to meet the demands of the retributive justice of God.

The *atonement* has for its object to restore that relation of man to God which sin had disturbed, and to reconcile the sinner to God.
Ullmann, Sinlessness of Jesus (trans.), IV. ii. § 2.

The doctrine of *Reconciliation* has not escaped the fate of other Christian truths; it has done and is doing its work in converting the world, and consoling many a crushed heart; but at the same time the terms in which it should be set forth have been disputed, and sometimes the doctrine itself denied.
W. Thomson, in Aids to Faith, Essay viii., Int.

We may have it as our privilege, I think, when our mind recoils from the tremendous difficulty of *propitiation* itself, to carry the whole matter up above the ranges of time, and look on him who stands there "in the midst of the throne, as it had been a Lamb slain from the foundation of the world."
H. Bushnell, Forgiveness and Law, i. 4.

In the great tragic poet Æschylus is a striking instance of *λύτρον* in the sense of an *expiation* or *atonement* for murder. The chorus of mourning women, bewailing the untimely end of Agamemnon, exclaim, "What *atonement* is there for blood that has fallen on the ground? . . . All the rivers moving in one channel would flow in vain to purify murder." *J. P. Thompson*, Theology of Christ, v.

=**Syn.** 1. Gracious, benign.—2. *Auspicious, Propitious*, promising. *Auspicious* cannot be safely used in any meaning beyond that of giving omen or indication of success; an *auspicious* event is one that seems an omen of prosperity for that which follows. *Auspicious* could be applied to a person only by a highly figurative use of the word. The earlier tendency to use the word outside of the limits here indicated is not now sanctioned by good usage. *Propitious* applies primarily to persons, but may be freely extended by figure to things. *Propitious* goes beyond *auspicious* in representing a benign disposition and manner, leading one to expect a kind reception and help.

A *proposal* is something proposed to be done, which the person addressed may accept or reject: as, a *proposal* of marriage. A *proposition* may be something proposed for discussion, with a view to ascertaining the truth or the wisdom of it: as, a *proposition* in Euclid; few now refuse assent to the *proposition* that the earth is round. *Proposition* is likely to be applied to a *proposal* which is deliberated upon, discussion and deliberation being associated with the word *proposition*, and action with the word *proposal*: as, a *proposition* to build a new dam, if it will not cost too much; a *proposal* to build it for $10,000. 3. A representation in thought or language of an act of the mind in thinking a quality or general sign, termed a *predicate*, to be applicable to something indicated, and termed a *subject*. This connecting of predicate and subject may range from a mental necessity to a mere impulse to look at a certain possibility. These differences are called differences in the *mode*, or *modality*, of the proposition, according to which, as ordinarily stated, propositions are either *de inesse* (that is, the mode is not considered) or *modal*, and in this case *problematical*, *contingent*, or *apodictic*. The modality may properly be said to affect the copula, or form of junction of the predicate and subject. The predicate, logically speaking, embraces the whole representation of the quality of the fact. Thus, in the proposition "Elijah was caught up to heaven," the grammatical predicate is "was caught up to heaven"; but the logical predicate includes the whole picture which the sentence conveys — that of a man caught up to heaven. The predicate, however, is not a mere picture; it views the fact represented analytically, and distinguishes certain objects as identical with the subjects. There may be only one subject, or, if the predicate expresses a relation, there may be several. These subjects cannot be sufficiently indicated by any general description, but only by a real junction with experience, as by a finger-pointing. In ordinary language they are for the most part but imperfectly expressed. In whatever way they are represented, they can commonly (in the last analysis always) be set forth in classes only; from such a class the subject meant is to be taken in one or other of three ways: first, by a suitable selection, so as to render the proposition true; secondly, by taking any one, no matter which; thirdly, by taking no matter what one among a selected proportion of those which present themselves in experience. The first mode of selection gives a particular proposition, as "An object can be selected which is a man caught up to heaven"; the second mode gives a universal proposition, as "Take any object you please in this world, and it is not a man caught up to heaven"; the third mode gives a statistical proposition, as "Half the human beings in the world are women." If there are several subjects, the order of their selection is often important. Thus, it is one thing to say that having taken any man you please a woman can be found who was his mother, and quite another to say that a woman can be found such that, whatever man you select, that woman was that man's mother. Several of the distinctions between propositions found in the old treatises are based on distinctions between the different categories (or, in modern logical language, *universes*) from which the subjects are understood to be drawn. Such is the distinction between a *categorical proposition*, whose subject is denoted by a noun, and a *hypothetical proposition*, whose subject is a hypothetical state of things denoted by a sentence. Such is also the distinction between a *synthetical proposition*, whose subject is drawn from the world of real experience, and may suitably be denoted by a concrete noun, and an *analytic proposition*, whose subject is drawn from a world of ideas, and may suitably be denoted by an abstract noun. Propositions are further distinguished according to the forms of their predicates; but these distinctions, unlike those already noticed, merely concern the form under which the proposition happens to be thought or expressed, and do not concern its substance. The predicates of propositions are either simple, negative, or compound; and in the latter case they may conveniently be considered (by a slight fiction) as either disjunctive or conjunctive.

A *proposicion* is a perfeicte sentence spoken by the indicative mode, signifiyng either a true thing or a false without al ambiguite or doubtfulnesse.

5. In *rhet.*, that which is offered or affirmed as the subject of the discourse; anything stated or affirmed for discussion or illustration; the first part of a poem, in which the author states the subject or matter of it: as, Horace recommends modesty and simplicity in the *proposition* of a poem.

It is very disproportionable for a man to persecute another certainly for a *proposition* that, if he were wise, he would know is not certain.

6. In *music:* (*a*) The act or process of enunciating or giving out a theme or subject. Specifically — (*b*) The subject of a fugue, as distinguished from the *answer*. — **Absolute, adversative, affirmative, ampliative, analytical, apodictic, assertory, binary, categorical, causal, cognate proposition.** See the adjectives. — **Composite proposition,** a proposition consisting of several propositions all asserted at once. — **Compound proposition,** a proposition consisting of two or more propositions, associated copulatively, disjunctively, conditionally, or otherwise. — **Comprehensive proposition,** a proposition in which the subject is regarded as a whole of logical comprehension including the predicate as a part. — **Conditional, conflictive, contradictory, contrary proposition.** See the adjectives. — **Contrariety of propositions.** See *contrariety*. — **Converted proposition, converting proposition.** See *convert*. — **Copulative proposition,** a proposition consisting of parts united by a copulative conjunction; a composite proposition. — **Correlative proposition.** See *correlative*. — **Cumulative proposition,** a proposition regarded as a compound of singular propositions, united conjunctively or disjunctively. Thus, "every man is mortal" is cumulative, as implying the first, the second, the third, etc., man to be, each of them, mortal. — **Descriptive proposition.** See *descriptive*. — **Dialectic proposition.** (*a*) A probable interrogation; a problem suitable for discussion. (*b*) An assumption of what appears likely. — **Dilemmatic, discretive, disjunct, disjunctive, divided proposition.** See the adjectives. — **Dual proposition.** Same as *binary proposition*. See *binary enunciation*, under *binary*. — **Elementary, equal, exceptive, exclusive, exemplar, explicative, explicatory, explicit, exponent, exponible, extensive, false proposition.** See the adjectives. — **Finite proposition,** a proposition whose predicate is not an infinitated term. — **Form of a proposition.** See *form*. — **Fundamental, hypothetical, hypothetico-disjunctive, identical, incident proposition.** See the adjectives. — **Impossible proposition,** a proposition which cannot be true. — **Indefinite proposition.** See *indefinite*. — **Infinite proposition,** a proposition whose predicate, affirmed of its subject, has the form of a negative: as, Every devil is non-human. — **Intensive proposition.** See *intensive*. — **Inventive proposition,** a proposition de inesse. — **Loaves of proposition**†, in *Jewish antiq.*, the showbread.

Under this fair heauen . . . there was the holy table, vppon whiche was set the holy bread, called the *loaves of proposition*.

Local proposition. See *local*. — **Major proposition,** a major premise. — **Minor proposition,** a minor premise. — **Modal, necessary, negative proposition.** See the adjectives. — **Numerically definite proposition,** a proposition which states how many objects, at least, there are of a given description. — **Obligistic proposition,** a proposition which has to be admitted in disputation owing to institution, petition, position, deposition, dubitation, or truth. — **Opposite propositions,** propositions having the same terms but not identical: as, Some woman is mother of some man; Some woman is mother of each man; Some woman is mother of every man; Every woman is mother of some man; All women are mothers of one man; Every woman is mother of every man. — **Particular, perfect, practical, principal, privative proposition.** See the adjectives. — **Possible proposition.** Same as *problematic proposition*. — **Predicative proposition.** Same as *categorical proposition*. — **Probable proposition,** a proposition stating with more or less determinacy how often within a certain genus of events a certain specific event would be found to occur, in a given range of experience. — **Problematic proposition,** a proposition asserting something to be possible in some sense. — **Proposition de inesse.** See def. 3. — **Proposition de necessario,** a proposition thought to be necessary. Such propositions were divided by the old logicians into (*a*) propositions *de necessario conditionali*, which stated something to be necessarily true, provided a certain condition held; (*b*) propositions *de necessario quando*, which stated something to be necessarily true at specified times; and (*c*) propositions *de necessario simpliciter*, or categorical apodictic propositions. The latter were further divided into propositions *de necessario simpliciter pro nunc*, or propositions stating something to be necessarily true now, and propositions *de necessario simpliciter pro semper*, stating something to be always necessarily true. — **Proposition de omni,** a universal proposition. — **Proposition in sensu composito,** a proposition in which the expression of the mode is attached to the subject or predicate. Such a proposition, as remarked by Scotus, is not, properly speaking, a modal but an ordinary proposition concerning possibility. — **Proposition in sensu diviso,** a proposition in which the expression of the mode is attached to the copula. — **Proposition per se,** a proposition which asserts something to be essentially true — that is, the universe is a universe of essences, not of existences. Four modes of such propositions are recognized by Aristotle: first, where the predicate is involved in the idea of the subject; second, where the subject is involved in the idea of the predicate; while the third and fourth modes are respectively modes of existing and of causing. — **Propositions of second adjacent, of third adjacent.** See *adjacent*. — **Pure proposition,** a proposition not modal. — **Pythagorean proposition.** See *Pythagorean*. — **Quantified proposition,** a proposition in which the manner of selecting the subject is fully expressed. — **Rational proposition,** a hypothetical proposition in which several categoricals are united by a causal conjunction. — **Reciprocating proposition,** one which asserts two terms to be coextensive: as, "Man" is identical with "rational animal." — **Relative proposition,** a proposition whose predicate is a relative term. — **Remotive proposition.** See *remotive*. — **Restrictive proposition,** a proposition with a restrictive clause: as, Christ, in his divine nature, is omnipresent. — **Simple proposition.** (*a*) Properly, a proposition whose predicate is simple: as, There is a man. (*b*) Usually, a categorical proposition, or one expressed by means of a noun and a verb, as contradistinguished from a *conditional proposition*. — **Singular proposition,** a proposition whose subjects are single individuals: as, Cain killed Abel. — **Spurious proposition,** a proposition one of the subjects of which is a character designated as one of those which belong to a given group. Thus, from the premises, Every European wants some character of Americans, and Every nobleman possesses some character other than those that are common to Americans, we can infer, first, that every European wants some character different from some character common to noblemen, and that every nobleman possesses a character different from some character wanting to every European. These are spurious propositions. — **Statistical proposition,** a proposition which states how many objects of one kind there are in connection with each one of another kind, in the average of a certain line of experience. — **Subaltern proposition,** a proposition asserting a part, and only a part, of what is asserted in another proposition. — **Subcontrary propositions,** propositions which have the same terms and may be true together but cannot be false together. — **Syllogistic proposition,** a proposition forming part of a syllogism. — **Synthetic proposition.** See *synthetic judgment*, under *synthetic*. — **Temporal proposition,** a proposition consisting of two categoricals united by a temporal adverb. — **Ternal** or **trinary proposition,** a proposition of third adjacent. — **Theoretical proposition,** a proposition concerning the fact, not concerning what ought to be done. — **True proposition.** See *true*. — **Universal proposition,** a proposition whose subject is any object whatever in the universe of discourse: as, Take any object you please, you will find it not a griffin. Every such proposition states the non-existence of something. If, in addition, it asserts the existence of something, it should be regarded as a composite proposition, partly universal and partly particular. But many logicians divide universal propositions into different species according as they do or do not assert the existence of their subjects. The result of this mode of treating the subject is a highly complicated doctrine. — **Unquantified proposition,** an indefinite proposition. = **Syn. 2.** *Overture*, etc. See *proposal*. — 3 and 5. Position, thesis, statement, declaration, dictum, doctrine. *Proposition* differs from the words compared under *subject*, in that it is the technical word in rhetoric for the indication of the theme of a discourse.

The *proposition* is that part of a discourse by which its subject is defined. It includes, therefore, but is not restricted to, that which is termed *proposition* in the nomenclature of logic. It embraces all varieties of rhetorical form by which a *subject* is indicated to the audience. An interrogative may be in rhetorical dialect the *proposition*.

Where such stays pass through flues of steam-boilers, they are usually made tubular, thus permitting water to flow through them as a protection from overheating, while at the same time their exteriors become more or less effective heating-surfaces. The so-called Galloway boiler is a good example of the use of tubular prop-stays.

In its various modifications prosenchyma forms the vascular and skeletal parts of plants, as distinguished from *parenchyma*, or the cells which constitute the soft tissues of plants. See *parenchyma*. In most of the lower plants it is barely if at all developed, but in the higher plants it exists as a skeleton which brings all the parts into closer relation. The solid wood of trunks and the veins of leaves are familiar examples. As in parenchyma, the cells composing this tissue are very various in form, size, etc., and have been minutely classified, yet they may be reduced to a few comparatively simple types. These cells, which are normally of considerable length in proportion to the transverse diameter, are generally more or less sharply pointed, and are divided into typical wood-cells and woody fibers (including libriform cells and secondary wood-cells) and vasiform wood-cells or tracheïds. The most important modification is that in which cells belonging to this system unite to form long rows in which the terminal partitions are nearly or quite obliterated, throwing the cavities into one, forming a duct. These ducts or vessels may be pitted, spirally marked, annular, reticulated, or trabecular. A modification in a different direction produces bast-cells, bast-fibers, or liber-fibers. See also *wood-cell*, *libriform cells* (under *libriform*), *duct*, 2 (*b*), *bast*[1], 2, *liber*[1], 1.

Περσεφόνη, also Περσεφόνεια, Proserpine (see def.), traditionally explained as 'bringer of death,' < *φέρειν*, bring (see *bear*[1]), + *φόνος*, death (see *bane*[1]); but this explanation, untenable in itself, fails to apply to the equiv. Περσέφασσα, Περσέφαττα; these forms, if not adaptations of some antecedent name, are appar. < *περσε-*, a form in comp. of *πέρθειν*, destroy; the second element *-φονη* may be connected with *φόνος*, death, *-φασσα* with √ *φα*, shine.] In *Rom. myth.*, one of the greater goddesses, the Greek Persephone or
